IT may be stated that the success of any institution depends upon the efficiency of its individual composition. This is evident, as all work planned or produced is the result of human thought. Every institution has four departments: the Finance, Executive, Producing and Sales. Each one of these departments is of equal importance, yet the greatest money value is represented in the Producing Department. Thus, a highly efficient Sales Department may be employed at less price than a Producing Department. It is, therefore, of extreme importance that the individuals of this latter, work at highest efficiency. Any considerations, tending toward the realization of this efficiency, should be of paramount interest.

Below is a diagram of shop conditions relative to Producing Department efficiency :

Employes' Efficiency.

An employee's efficiency depends upon two things—ability and willingness to do the work. As far as ability is concerned, it is dependent upon three considerations : firstly—powers of perception, of which in nearly every case sight is of the greatest importance ; secondly—brain, or intellect, to direct ; and lastly—body to perform the work. Willingness to labor depends upon conscious and subconscious will. Consciously, wages are largely influential in producing the will to work ; subconsciously, the realization of fair treatment by employers, and conditions in the factory tending toward health, such as correct illumination, temperature, ventilation, sanitation, etc. It will be noticed that in in both divisions of ability and willingness, light is a strong consideration. If a man cannot perceive or see, he cannot plan or execute. Again, if the illumination is such as to strain his eyes, producing mental fatigue and nervousness, he will unconsciously be unwilling to work. The thorough consideration, therefore, of the qualities of illumination which will produce the desired results toward ability and willingness are of interest.

Important Lighting Considerations.

Important Lighting Considerations.

Below is a diagram of shop conditions relative to Producing Department efficiency :—

Efficiency of Individuals of Producing Department depends on their	Ability to Work	Perception	Sight	Natural Light Artificial Light
			Sound Touch Taste Smell	
		Intellect aided by	Education System Experience	
		Body aided by	Machinery and power to operate same	
		Conscious will Dependent on	Wages (Market price)	
			Treatment	
	Willingness to work	Subconscious will dependent on	Conditions tending toward physical welfare	Correct Light Temperature Ventilation Sanitation

Quality of Illumination.

There are four qualities in illumination which should be considered: first—the correct amount of light, that is, the happy medium between dimness and dazzling brilliancy; second—the lack of glare of high intrinsic brilliancy; third—the lack of flickering; and lastly—the elimination of harmful radiations. Under the correct amount of light we may say that the eye is able to work under a broad range of intensities. Thus, we can often read accurately in moonlight and still do so in dazzling sunlight ; the latter being over a million times the brilliancy of the former. It may be stated, however, that dependent upon the class of work, the eye should be exercised under from $\frac{1}{2}$ foot candle to 15 foot candles. Glare is an extremely harmful characteristic in any illumination. It not only cuts down the ability of the eye to see accurately, but produces eyestrain and nervousness. Flickering is also an extremely deleterious quality.

Its results are about the same as are produced by glare—inefficiency of the eye in working together with eyestrain due to the rapidity with which the eye tries to re-focus under the different intensities. This quality may be brought about in one of two ways. Either the light source varies in intensity, or the light upon a given plane of working is not even. In each case the eye must re-focus very often.

The most effective rays in producing vision are the yellow and green. The rays on either side of these in the natural spectrum are of less practical value, since they require to be much more powerful in order to produce the sense of vision, and hence strain and fatigue the eye to a correspondingly greater extent. The red and heat rays are particularly irritating for this reason, and the different colors also produce well-known mental effects. Thus red is exciting, while blue and violet are depressing. The use of a red flag in bull fights, and the well-known expression "feeling blue," are recognitions of this fact. Yellow gives contentment, while green is restful.

Important Lighting Considerations.

The Mercury Vapor Lamp.

The mercury vapor lamp has qualifications which are extremely advantageous to industrial illumination. It is a scientific fact that the eye will focus more accurately under the green rays produced by this lamp than under a combination of the seven colors of the spectrum. For this reason it is extremely advantageous to employ the light where accurate eye work is required. It is evident for the same reason that the eye can also see more distinctly under lower intensity of illumination with green light than with a combination of the seven colors of the spectrum. The application of this to industrial illuminations results in the ability to entirely eliminate auxiliary lights of small candle power, where ordinarily the illumination from an over-head system would not be sufficient.

The light produced by the mercury vapor lamp, is extremely low in intrinsic brilliancy, the amount of light being produced rather from the area than from the brilliancy of the source. This secures a total absence of glare, not only where the source is directly exposed to the eye, but from polished surfaces. Reflection of glare from polished surfaces is found to be extremely annoying and of as serious a character as the exposing of the direct rays of the lamp. Where these lamps are employed, the system is of an overhead character. The lamps are placed to light a certain number of square feet, and are laid out symmetrically regardless of the placing of the work beneath. This produces a perfectly evenly distributed light on the floor. It may be seen, therefore, that upon a working surface no different intensities of illumination will be found, and, therefore, the eye will not be called upon to re-focus. The source, a tube varying in length with the different types of lamps, is a steady line of light, being in any given period, of exactly the same intensity. The length of the source is a decided advantage, tending towards distribution and the elimination of distinct shadows.

Analysis of Values.

An analysis of the qualities of the mercury vapor lamp, will show that where color values are of little importance, the other qualities of the light are exactly those which are required to produce correct illumination for employees in industrial work. The importance of this cannot and must not be overlooked. For instance, in one of the large silk mills of the east, it is figured by a well-known cost expert that the expense of producing their product at night is 20 per cent. higher than that of producing it in the day time. This may be due to several things, but must be largely attributed to inferior illumination. Had these people in their factory an illumination during the dark hours as good for working purposes as the best daylight, their cost of production during that time, would very evidently be largely decreased. It seems strange that the importance of this consideration has been overlooked, particularly in view of the fact of the extremely low comparative cost of units of illumination and their operation.

Factory Production of Power.

A large modern factory, it may be figured, can produce power at a cost of one cent per kilowatt hour. A mercury vapor lamp can be run five hours at a power expenditure of one kilowatt hour. On an average in industrial lighting one mercury vapor lamp will take care of at least two men. Figure an average cost of 40 cents per hour to employ these two men. This would mean an expense of $3.00 to employ these two men five hours, whereas perfect light for them can be produced for one cent. In other words, if perfect light will save one-half of one per cent. of a man's time, it has paid for its total cost of operation. Not only that, but the value of machinery and factory investment is increased in proportion as the efficiency of the men is increased. Thus, with improved illumination it is not difficult to imagine that 20 machines will do the work that 25 had done heretofore. The value of the given investment has increased 20 per cent., or probably ten times the value of the lighting units to produce this result. These are the important considerations in any lighting installation, and cannot be overlooked. Any system of figuring which does not consider these points is entirely fallacious and can mean but little.

WARNINGS.

The Manchester Steam Users' Association issues the following :

Don't overload the safety valves or tamper with them.

Don't let the water level sink out of sight.

Don't allow the cocks and valves to set fast.

Don't open the steam stop valves hurriedly.

Don't empty the boiler while steam is up.

Don't open manholes before easing safety valves.

Don't raise steam hurriedly.

Don't use unknown scale solvent or compositions.

Machinery Display at the Canadian National Exhibition

The Machinery Displayed at the Recent Annual Canadian National Exhibition in Toronto, Was at Least Up to Its Previous High Standard of Excellence—The Exhibition Was Open From Aug. 26 to Sept 11, During Which Time Over 926,000 People Passed the Turnstiles—The Machinery Hall Proved All Too Small, and a Number of Exhibits Had to Find Accommodation in Tents Outside—Much Advantage Was Taken of the Opportunity by Mechanics, and Numerous Inquiries and Sales Were Reported.

EXHIBITORS.

The Chapman Double Ball Bearing Co., Toronto, showed many examples of their well-known annular ball bearings and double ball thrust bearings. To demonstrate the small amount of power absorbed by these, seven of them were placed upright on the floor in a line, and driven from a countershaft by six "belts" consisting of fine twine, the countershaft itself being driven by a similar belt of twine from the line shaft.

Jones & Glassco, Montreal, showed numerous examples of Renolds' Silent Chain for which they are sole Canadian Agents. This driving chain is well-known to all power users. Among their other exhibits were specimens of the Kenyon patent inter-stranded cotton driving rope, made by Wm. Kenyon & Sons, Ltd., Dukinfield, Manchester, Eng.

D. K. McLean showed their well-known British oak-tanned leather belting, besides steel split pulleys and other mill supplies.

The Dominion Abrasive Wheel Co., New Toronto, had an attractive display of vitrified emery wheels, including a ring wheel 30 inches diameter, 2 inches thick and 6 inches high. All types and sizes were shown from wheels ¾-inch diameter by ¼ inch thick, for internal grinding, up to 30 inches diameter by 3 inches thick.

The Borden-Canadian Co., Toronto, were kept busy demonstrating the Beaver die stocks for threading and cutting pipe. These die stocks have adjustable dies which do not require to be changed for the different sizes of pipe. Thus, the 6-inch die stock will cut all sizes of dies, and moreover, can be operated by one man.

John Millen & Son, Montreal, exhibited Cyclone high speed chain blocks, Wright monkey wrenches, Stover pipe wrenches, a good display of Coventry noiseless chain drives and Hoffman ball bearings.

The Dominion Belting Co., Hamilton, Ont., showed driving and conveyor belts made from their "Maple Leaf" stitched cotton duck.

The General Machinery Co., Traders Bank Bldg., Toronto, showed a 3-H.P. Luitwieler Pump in operation. This pump is of the cam driven, non-pulsating type, the absence of water jar and vibration being very marked. The pump was motor-driven through gears, and was exhibited standing upon four water glasses. The delivery pipe was throttled to represent a head of about 40 pounds, yet no vibration could be seen on the surface of the water in the glasses.

The Canadian Hart Wheels, Hamilton, Ont., showed a large selection of their Beaver brand of razor hones and corundum grinding wheels.

The Boiler Repair and Grate Bar Co., Toronto, were demonstrating their 20th Century shaking and dumping grate bar. They also exhibited Bundy steam traps and other specialties.

The Jas. Morrison Brass Manufacturing Co., Toronto, were located in the Process Building where they had a large booth in which were displayed numerous and varied specimens of the work turned out by them. The exhibit included pressure gauges, counters, injectors, marine engine-room telegraphs, etc.

The Canada Metal Co., Toronto, were located near the south entrance to the Machinery Hall, where they had a good display of their well-known products, including lead joints and plumbers supplies of all kinds, fuse wire, copper ingots, battery zincs, pig lead, spelter, etc. In addition, samples of their many brands of Babbitt were shown, among which the Harris Heavy Pressure occupied a prominent place.

The Dodge Manufacturing Co., Toronto, occupied a large space with their well-known products for power transmission, including split wood pulleys, bearings, hangers, etc.

The Canadian Mathews Gravity Carrier Co., Toronto, had three types of ball-bearing gravity carriers in operation together with an automatic inclinable elevator. Much interest was shown by visitors to this exhibit.

H. W. Petrie, Toronto, are Canadian agents for the Keighley Gas and Oil Engine Co., England and showed three gas engines by that company, all operating on producer gas. The largest was 65 B.H.P.; the other two being 30 and 12 B.H.P. respectively. They also had a comprehensive exhibit of machine tools, including a Lodge and Shipley 14-inch tool-room lathe having double back gears, quick change speed gears, taper turning attachment, and thread-chasing attachment. There was also a 42-inch Cincinnati Bickford radial drill and an Acme turret lathe of 1½ by 9-inch capacity, having power feed to turret automatic chuck and wire feed.

The Canadian H. W. Johns-Manville Co. exhibited their asbestos products, roofing material, fibre conduits for underground wiring, J-M and Red Seal dry batteries, and high temperature cements for furnaces. The booth was lighted throughout by the J-M Linolite system of illumination, which is especially suited for show-cases, shop windows, etc.

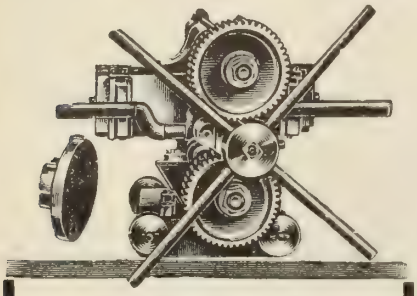
The Campbell Gas Engine Co., Halifax, England (Agents, Chambers & Simpson, Bay St., Toronto) installed a 25 H.P. gas engine operating on gas obtained from their suction gas producer. They also exhibited a 13 H.P. coal oil engine, fitted with tube ignition and water injector.

The Canadian Steam Boiler Equipment Co., Toronto, were demonstrating their Cyclone shaking and dumping grate bar and also had exhibits of feed pumps and Economic vacuum valves.

Wm. & J. G. Greey, Toronto, had a large show of flour mill machinery, among which were an improved oat-flaking machine, a dough mixer and adjustable dough divider for cutting up dough into equal portions. The exhibit also included steel conveyor buckets, hand trucks and general mill furnishings.

The Garlock Packing Co., Hamilton, had on hand a full line of their packings under charge of H. G. Fletcher, manager of their Toronto branch.

The Acheson Oildag Co., Sarnia, showed Aquadag and Oildag samples. The former is a cutting compound and the latter a lubricating compound. Graphite in an extremely fine state of sub-division forms the principal constituent of each.



The Canada Machinery Corporation, of Galt, exhibited wood and iron-working machinery. The former consisted of a Fay-Egan glue jointer, a Falls undercut face planer, 16-inch buzz planer with Falls automatic feed for hand planing, and a hollow chisel machine mortiser. The iron working machinery consisted of one 26 by 16-inch engine

lathe with quick change speed gears, one 16 by 8-inch ditto, and one 16-inch crank driven shaping machine.

The Northern Electric Co. had a commanding corner position in the Industrial Building, where they demonstrated their fire alarm apparatus, telephones, etc.

The Ontario Wind Engine and Pump Co., Toronto, were located in a large tent on the grounds, where they had ample space to display their exhibits. They showed Stickney gasoline engines ranging from 3 to 7 H.P. One of the latter was shown in operation not bolted down, but merely resting on two pieces of iron pipe which were free to roll. In addition, the caps from both shaft journal bearings were removed, and the engine ran during each day with little vibration. Windmills, pumps, pitless weigh bridges were also shown.

The General Supply Co., of Canada, had as their largest exhibit a 25-inch engine lathe of the LeBlond type, built by the **London Machine Tool Co., Hamilton, Ont.** One of the chief features of this type lathe is the off-set centres. The centre line of the head and tailstock is set back off the centre line of the bed, so that when work of large diameter is being turned, the thrust on the tool is taken by the bed itself instead of by the overhanging part of the saddle.

The A. R. Williams Co. showed a good assortment of machine tools and specialties. One of the most prominent of their exhibits was a 14-inch tool room lathe by the Hendey Machine Co., Torrington, Conn. The special feature of the lathe is a quick threading attachment for rapid thread cutting. Its saving in time over ordinary methods is accomplished in the means by which the carriage is returned at high speed from the end of the cut to the starting point. This is accomplished by means of the quick return sleeve having a very coarse pitch and multiple thread. Other machines shown included a 36'' radial drill by the American Tool Co., Cincinnati; a Hendey Norton No. 2 universal milling machine, a No. 2 Warner and Swasey turret lathe having a capacity for 1 by 6-inch stock; 18 and 12-inch drill presses by W. F. & J. Barnes; and a 24-inch shaper by the McGregor-Gourlay Co., Galt. A machine attracting much attention on this stand was a No. 20 Sidney Universal Woodworker. This consists of a 16-inch jointer, 32-inch band saw, single spindle one-way shaper, rip and cut-off saw table and boring attachment, combined in one machine. An instalation showing the principle and operation of the Kewanee system of water supply was also on view.

The International Marine Signal Co., Ottawa, engineers and builders of steel and structural iron, exhibited their well-known Wilson's portable flare lights.

INDUSTRIAL AND CONSTRUCTIONAL NEWS.

FOUNDRY AND MACHINE SHOP.

Weyburn, Sask.—Acton & Montgomery have secured control of the Weyburn Machinery Co. and are conducting a machine shop and garage.

London, Ont.—A large American automobile concern have secured an option on certain property here and will likely decide to locate a plant.

Niagara Falls, Ont.—The Gaso-Electric Motors of New York and Toronto, have been negotiating location for a plant here.

Fort William, Ont.—The Copp Stove Works and the Harvester plant bonus by-laws were passed by the ratepayers.

Lindsay, Ont.—Mr. McComb is promoting a company which is desirous of establishing a malleable iron industry here. They propose spending about $25,000 for equipment and plant.

Medicine Hat, Alta.—Col. G. W. Loper, of Spokane, proposes establishing a smelter here for the treatment of zinc ores of the Slocan district by the recently discovered natural gas

Jessop's Best Tool Steel is yet unexcelled for cutting tools of all kinds, and for general machine-shop use.

Jessop's "Ark" High-speed Steel gives marvellous results —heavy cuts -- at rapid speed; cannot be burned.

The favorite brands with users of good steel.
A large assortment of sizes in stock.
Jessop's high-grade files and rasps.

Manufactured by **WM. JESSOP & SONS, Ltd.** Sheffield, Eng.

process. This process has been singularly successful in Missouri.

London, Ont.—This city has for some time been under the scrutiny of a million dollar steel concern from England, which proposes establishing in Canada. Chas. Cook, president of the Positive Clutch & Pulley Co., of Toronto, succeeded in interesting them in this country.

St. Thomas, Ont.—Orders have been received here to complete work on the new M.C.R. roundhouse. Sixteen stalls were erected in 1910, and twenty-five more will now be added at a cost of $50,000.

Windsor, Ont.—The Hupp Motor Car Co. are preparing to erect two factory buildings at a cost of $25,000, and will employ about 175 men.

Berlin, Ont.—John Hahn, foreman in the L. E. Shantz foundry, is opening a machine shop here at the rear of the Pearl Laundry.

Windsor, Ont.—The A. E. White Machine Works, of Eau Claire, Wis., will erect a cement factory here next to the Hupp property at a cost of $6,000. They will manufacture saw mill machinery.

Prescott, Ont.—Chas. Plumb is disposing of his machine shop business here and contemplates going West.

London, Ont.—The C.P.R. is spending $65,000 for improvements, such as office building, works, etc.

Welland, Ont.—The Canadian Steel Foundries have acquired additional property here to make room for the extensions to be made in the spring.

North Vancouver, B.C.—McDougal & Jenkins, engineers, are erecting a $7,000 machine shop building here.

Cardston, Alta.—The Folsom Iron Works were overhauled and improved recently.

Vancouver, B.C.—Leave to proceed with the expropriation of large areas in the vicinity of Coquitlam for shops and yards was granted the C.P.R. recently by the Railway Commission.

Fenelon Falls, Ont.—The Art Iron Limited is establishing a $3,000 factory here and will spend about $5,000 installing machinery. The town is granting them concessions.

Orillia, Ont.—The Tudhope-Anderson Co. are erecting an extensive plant here. Among the buildings to be put up this year are a blacksmith shop 80x128 feet, foundry 80x192 feet, cupola room 40x40 feet, wagon shop 80x192 feet, two storeys, and boiler room 40x40 feet. The latter will be equipped with 125 h.p engine and three 110 h.p. boilers. Steam power will be used in the wagon department only—the machine departments will be operated by electric power. All the buildings will be steam heated. Manufacturing in the machinery department will likely be started next month.

Preston, Ont.—The Preston Car & Coach Co. have built an additional erecting shop. This and other improvements have increased the capacity by one-third.

Ottawa, Ont.—The Dominion Bridge & Steel Co., of Montreal, are erecting a large new storehouse in Eastview, for their machinery. It is of steel, and four storeys high.

Fredericton, N.B.—Thos. Myles, St. Marys, has secured the $15,000 contract for a modern machine shop, which the Smith Foundry Co. are erecting. The Smith people were organized to take over the N. B. Foundry business here, lately conducted by Smith Bros. There will be a machine shop, blacksmith shop and pattern department. A feature will be the 30-foot traveling crane, 10 tons capacity, which, as well as all the machinery, will be run by electricity.

Fort William, Ont.—The Canada Iron Corporation has decided to enlarge its plant here to double its present capacity.

Nelson, B.C.—A fire-bug was responsible for the destruction of the Hall Mines smelter here recently. The works are a total loss—$750,000.

Fort William, Ont.—The Universal Motor Truck Co., of Warren, O., will establish a works here. The plant will cost, with the equipment, approximately $350,000.

Welland, Ont.—The John Deere Co. are about to start the erection of their plant here. A large warehouse will be the first.

Preston, Ont.—Clare Bros. & Co. are taking steps to enlarge their molding shop.

London, Ont.—The Empire Mfg. Co. are at present building a smelter house on their premises, where all metal for factory use will be reclaimed, clarified and refined. The metal will be delivered to the foundry in No. 1 quality ingots. The building is about 150 feet by 50 feet, and besides the smelting plant, contains a laboratory where raw and finished material will be carefully analyzed. All washing and grinding will be done in the basement, which will also serve as a stores room. A Rockwell oil furnace will be used, having a capacity of 5,500 pounds per heat, and three to four heats per day will be run.

Stratford, Ont.—The McDonald Mfg. Co., Stratford, Ont., builders of traction engines, threshing machinery, etc., intend to double

12" RAPID BENCH TOOL GRINDER

The busiest machine in the shop. Keeps the tools in fine shape and saves time, all the time. No longer necessary to burn the fingers and draw the temper of good tools on a dry wheel. Moderate price too

Think it over and let us send particulars.

Also makers of Heavy Grinders and Power Hack Saws.

Our 1911 Catalogue of valuable information regarding

"CUSHMAN CHUCKS"

is now ready. Better write for it. It's free on request.

The Cushman Chuck Co.
Hartford, Conn., U.S.A.
Established 1862

the capacity of their plant by the addition of new buildings and equipment. About $50,000 will be expended on these improvements.

MUNICIPAL.

Ottawa, Ont.—Three by-laws, aggregating $305,000, for various purposes have been carried by large majorities.

Medicine Hat, Alta.—Five money by-laws for various purposes were ratified by the ratepayers.

Galt, Ont.—The ratepayers have passed a by-law to raise $10,000 for extending and adding to the waterworks system.

Calgary, Alta.—On October 3 the ratepayers will vote on by-laws totaling $856,000 for various civic purposes.

Penticton, B.C.—The ratepayers will shortly vote on money by-laws totaling $24,300 for local improvements.

Yorkton, Sask.—The ratepayers will be called on to authorize the raising of $9,500 for a waterworks system.

Swift Current, Sask.—The ratepayers will vote on several by-laws in the near future, one to raise $44,000 for a waterworks system, and another to raise $10,000 for the instalation of a sewer system and sewage disposal.

North Vancouver, B.C.—The city is contemplating an expenditure of $30,000 for a waterworks system.

Saskatoon, Sask.—The ratepayers have authorized the following by-laws: $75,000 for a water filtration plant; $73,000 for waterworks extensions; $15,000, machinery for board of works and board of health; $45,000 for sewers and water connections, and $225,000 for an intercepting sewer and sewage disposal plant.

High River, Alta.—The by-laws, to establish waterworks and sewerage systems, at a cost of $125,000, and to install new steam heating in the town hall, were carried.

Neepawa, Man.—The ratepayers have approved a by-law to expend $100,000 in the construction of waterworks.

Guelph, Ont.—The light and heat commission are asking for $30,000 to put the gas and electric light plant in A1 condition.

ELECTRICAL.

Lindsay, Ont.—The ratepayers will shortly vote on a by-law to purchase the plant of the Seymour Power Co.

St. Mary's, Ont.—A by-law to raise $15,000 for electric power extensions will be voted on, Oct. 14.

Saskatoon, Sask.—The following by-laws were ratified by the ratepayers: $75,000 for electric light extensions; $80,000 for a new power house, and $135,000 for an electric light and power plant.

Grimsby, Ont.—A by-law to loan $10,000 to the Radiant Electrical Co. was passed by a large majority.

Davidson, Sask.—The town is spending $10,000 for electric light purposes.

Yorkton, Sask.—On October 6 the ratepayers will vote on a by-law to raise $5,100 for electric light purposes.

Moose Jaw, Sask.—The street railway system has been in operation a little over a month now. A significant feature of the system is the type of engines for the power house. They are Diesel oil-burning engines made by an English firm.

GENERAL MANUFACTURING.

St. Thomas, Ont.—T. W. Edwards, of this city, has secured a substantial interest in the Canadian Voting Machine Co., of Niagara Falls. They will erect a small factory later on, the place not yet being decided.

Simcoe, Ont.—The town has voted to erect a $20,000 factory for the Southam Lithographing Co.

Winnipeg, Man.—Work on the buildings and plant of the Alsip Sandstone Brick Co. is practically completed. The cost has been nearly $100,000. The machinery being installed is of a German type and said to be the best in existence.

Bridgeburg, Ont.—The Lautz Co., marble mills, of Buffalo, will erect a $35,000 plant here, and employ about 40 men.

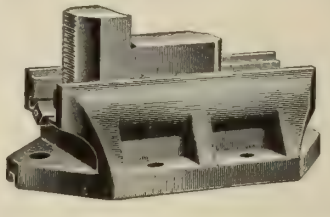
BUILDING NOTES.

Edmonton, Alta.—The city is contemplating the erection of a city hall, to cost about $500,000.

Winnipeg, Man.—The C. P. R. will erect a 14-storey hotel here, "Hotel Selkirk," at a cost of $1,500,000. It will be the last word in modern architecture.

SAW AND PLANING MILLS.

Lennoxville, Ont.—The Standard Box Factory was destroyed by fire recently; the fire started near the boiler room.

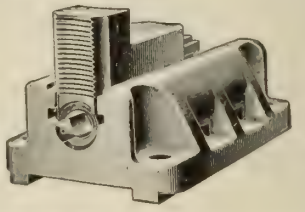


Fort William, Ont.—The saw mill and blacksmith shop at Stanley, owned by T. P. Kelly, were burned out, causing a loss of $7,000.

Goderich, Ont.—The Spanish River Lumber Co. is opening a yard here.

Coboconk, Ont.—The planing mill of the Gull River Lumber Co. was destroyed by fire some time ago. The loss is about $4,000, partly covered by insurance.

Face Plate Jaws



New features include extra large screws, double thrust bearings and special methods of attaching, permitting their use on various-sized face plates.

Ends pointed at an angle of 45 degrees, so that four jaws will fit close together at centre. Sizes 4-in. to 14-in

Boring Mill Jaws

As in the face plate jaws, screws are larger than usual, thrust bearings are double and jaws are wider, heavier and better supported. Made in all steel or with grey iron base as desired.

Makes Morrow make uniform.

DON'T ALLOW ANY FIRM TO SELL YOU INFERIOR MAKES.

The JOHN MORROW SCREW, Limited, INGERSOLL

Sarnia, Ont.—The planing mill of the Ludlaw-Ainslee Lumber Co. was burned out, causing a loss of $8,000, partially insured.

Woodstock, Ont.—The plant of the Woodstock Woodworking Co. was badly damaged by fire recently. The boiler and the dry house were destroyed.

Ailsa Craig, Ont.—The saw mill owned by Samuel Gillies was badly wrecked by a severe storm recently.

Shelburne, Ont.—The up-to-date planing mill owned by George Mustard was wiped out recently by a bad fire.

Port Alberni, B.C.—The Canadian Pacific Lumber Co. are erecting a sawmill here, with a capacity of 75,000 feet per day. The plant and buildings will cost $50,000.

TRADE NOTES.

The Grand Trunk Railway Co. has given a contract to the Canadian Car & Foundry Co. for the construction of 1,000 box cars of 60,000 pounds capacity, each, with underframes of steel, and equipped with Westinghouse air brakes and latest appliances. They have also asked tenders for ten 30-foot and ten 40-foot steel underframe flat cars.

The Canada Iron Corporation has issued its report for the fiscal year ending May 31. Although some of the plants are undergoing construction and not up to full working capacity, the earnings were good. Profits for the year were $401,885, and bond interest $175,200, leaving $226,685, subject to some minor changes. The surplus, added to the balance of $149,427 brought forward from the previous year, made $359,807 of undivided profits carried forward. Since the close of the fiscal year, the corporation's position has been improved materially through the acquisition of valuable assets which will not show in the statements until next year.

The Canadian Department of Railways and Canals asks for tenders up to Oct. 16 for 30,000 gross tons of 80-pound steel rails, 1,700 gross tons of spike bars and 5,000 kegs track spikes of 200 pounds per keg, for the Hudson Bay Railway.

The Canadian Locomotive Works, Kingston, Ont., has been awarded a contract by the Grand Trunk Pacific Railway for the construction of 25 large locomotives. The company has now work ahead for a year or more.

The Dennis Wire & Iron Co., London, Ont., are extremely busy at present, and are receiving more orders than they can expeditiously handle. They will extend their plant next spring by the addition of another storey to the north wing of their factory.

Royce Limited, Electrical and Mechanical Engineers, Trafford Park, Manchester, have been awarded an order by the Great Eastern Ry. for 11 electrical capstans of the "Royce" patent free bollard type, and spares for use on the company's wharf and goods yard at Blackwall. The order also comprises ten electrical jib cranes, two electrical hoists and spares.

The Jeffrey Mfg. Co. have closed a contract with the Can. Westinghouse Co. to install a coal conveying plant in their power house at Hamilton. They have recently installed coal-handling machinery at the Can. Light, Heat & Power Co.'s terminal station, Montreal, and in the Grand Trunk Ry.'s new plant at Ottawa. They are at present erecting machinery in the National Transcontinental shops in Winnipeg.

The Coventry Chain Co., Coventry, Eng., has been awarded a gold medal for the excellence of their chains exhibit at the Festival of Empire Exhibition, Crystal Palace, London, England.

The Dominion Bridge Co., Montreal, are constructing four electric cranes for the Canadian Steel Foundries, Limited. All four are for use at the Montreal Steel Works, Longue Pointe, and are of 70 foot span. They are equipped with auxiliary hoists. Two cranes are of 15 ton capacity and two of 20 ton capacity. Dynamic braking controllers are fitted, which render the use of ordinary friction lowering brake unnecessary. They are specially designed for steel foundry service and have all gears enclosed in dust and oiltight cases.

The same company is also building a 10-ton crane for the Canadian Car & Foundry Co., of 72-foot span, and equipped with alternating current motors.

The installation of a 20-ton crane with runway has just been completed at the works of the Dominion Marble Co., Turcot, Montreal. This latter is now handling great blocks of marble in a most satisfactory manner. It also is equipped with dynamic braking controllers. Recent crane shipments include a 10-ton crane of 90 feet span, to Toronto, equipped with alternating current motors, together with a runway 700 feet long, and practically a duplicate to Winnipeg.

Beauchemin & Fils, Limited, Sorel, Que., are making a large edition to their foundry. The new structure is to be 80 by 100 feet and

is to be most modern in every particular. The structure of steel is being erected under the supervision of Mr. J. M. Ryan, formerly of the Montreal Steel Works. The equipment will include two converters of 2½ tons capacity each and electric cranes. The firm manufactures steel castings of all sizes, including a good deal of railway work.

The Advance Machine Works, Montreal, recently supplied the road department of that city with twelve concrete spreaders. They are agents for the Waterloo Cement Machinery Corporation, who make the Polygon Concrete Batch Mixer, fitted with Polygon motion on account of the obliquity of the axis of revolution. A high capacity output is claimed for these machines.

CATALOGUES.

The Bignall & Keeler Manufacturing Co., Edwardsville, Illinois, have forwarded us a catalogue descriptive of their line of improved pipe threading and cutting machines. The firm are specialists in this work, having been engaged in designing and building this class of machinery for more than thirty years. Three types of pipe machines are made, known as the Peerless, the P.D.Q.C., and the Duplex. The die adjusting mechanism is the same on all, and together with all other details, is minutely described and illustrated with numerous excellent half-tones.

The Peerless machine is made in three sizes, having capacities of ¼-inch to 2 inches, ¼-inch to 3 inches, and 1 inch to 4 inches. The dies are closed or opened by a single movement of a lever placed conveniently to the operator's hand, and on all but the smallest size, the drive is through a change speed gear box. The cut-off slide is placed on the back of the head and is provided with a gib for taking up the wear. A speed plate is attached to the gear box, showing how to set the levers for obtaining the correct speed for different sizes of pipe. The change gears are of steel with machine cut teeth and run in an oil bath. Each machine is furnished with a direct connected oil pump, and the bottom of the bed slopes towards the rear, allowing the oil to drain into the back, away from the chips. The Peerless type of machine is equipped with a gripping chuck placed on the front end of the spindle, and having V-shaped jaws. It is universal, and can be quickly adjusted to suit different diameters of pipe.

The P.D.Q.C. machine derives its name from being equipped with Peerless dies and a quick acting chuck. The latter can be operated by a lever while the machine is running, so that when the machine has been set for a certain size of pipe, it need not be stopped until another size is to be threaded. In other respects this type resembles the Peerless in general design.

The Duplex type is intended for the larger sizes of pipe, the heaviest machine having a capacity of from 4 to 12 inches. Two chucks are provided, one at either end of the spindle, to enable large pipes to be very securely gripped for both threading and making up fittings. All three types of machine can be arranged for either a belt or motor drive with silent chain.

The catalogue is printed on faced paper and is so clearly written and illustrated that prospective purchasers cannot fail to get an exact idea of the construction and operation of the various machines.

The Best Manufacturing Co., Pittsburg, Pa., have sent us a copy of their standard tables of Valves, Fittings, Flanges, Pipe, Bends, etc. This folder measures 6½x4 inches and is less than ¼-inch thick, yet it contains a large amount of information. It is printed on cloth to allow of rough handling; the size making it convenient for pocket use.

The Thos. H. Dallett Co., Philadelphia, Pa., have sent us a pamphlet setting forth the principal features of their pneumatic boiler scaler. The tool is a pneumatic hammer of special form, weighing only 27 ounces, and strikes about 3,000 light, uniform blows per minute, cracking the scale without injuring the sheet. Special chisels are used, blunt on the edge, and the air consumption is given as 4 cubic feet per minute.

The Deeming Company, Salem, Ohio., have issued a handsome catalogue of 190 pages, describing their numerous types of power pumps. These include single and double acting triplex pumps for various services, deep well power working heads, artesian well cylinders, rotary and centrifugal pumps, etc. The catalogue is profusely illustrated and is complete in every respect. A copy should be filed by all users and prospective users of this class of machinery.

C. N. E. POWER EXHIBITS.

The Canadian H. W. Johns-Manville Co. had a large selection of their numerous asbestos products, including packing, roofing material, furnace cements, etc.

Laurie & Lamb, Montreal, exhibited a model of the latest type of refuse destructor, made by Heenan & Froude, Manchester, Eng. This method of disposing of town's refuse is much more widely used in Europe than it is on this continent. Laurie & Lamb have installed two sets in Canada, namely, at Westmount, P.Q., and Vancouver, B.C., and have orders on hand for similar installations at Ottawa, Moose Jaw and Calgary. In the Heenan & Froude destructor the garbage is introduced through a hopper at the top, from whence it falls on to a dead plate at the back of the grate. After remaining there for a few minutes to partially dry, it is raked forward into the trough-shaped grate and thoroughly consumed, the heat being used for raising steam or other purposes. The trough grate has perforated sides, through which forced draught is introduced. The hot gases, before reaching the stack, pass through a regenerator, which raises the air for combustion to a temperature of about 250 degrees Fahrenheit. The average temperature in the furnace is 2,000 degrees, and it is only by maintaining this intense heat that garbage can be successfully dealt with. Approximately one-third of the refuse comes out of the furnace again in the form of a hard clinker, and free of all organic matter. It has a definite commercial value, being largely used in concrete floors and other purposes. Heenan & Froude have introduced a simple mechanical clinker remover, which is generally used in combination with their destructors. The model was shown in an annex to the Public Health Exhibit, and, we fear, was missed by many visitors who would have been interested in it.

Jones & Glassco, Montreal, showed many artistically-arranged examples of the well-known Renold silent chain, for which they are sole Canadian agents. This chain is so well known to power users as to need no further comment. Kenyon's patent inter-stranded cotton driving ropes were also shown, Jones & Glassco being also sole Canadian agents for this specialty.

The Ontario Wind Engine & Pump Co., Toronto, showed a large number of Strickney gasoline engines. One of 7 h.p. rested on two rollers of iron pipe without being bolted down. In addition, it had the covers removed from both journal bearings, and ran all day with very little vibration. The governor can be adjusted while the engine is running, and has a wide range.

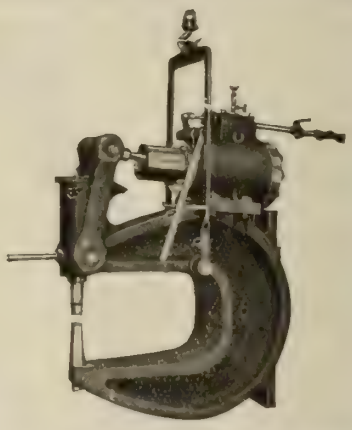
Canadian Agents: H W PETRIE, Toronto Ont. WILLIAMS & WILSON, Montreal, Que.

John Millen & Son, Montreal, had a large show case display of Coventry noiseless chain for driving purposes. Another prominent feature of their exhibit was a group of Cyclone high-speed chain blocks ranging in capacity from ½ to 40 tons. Hoffman ball bearings, Wright monkey wrenches and Stover pipe wrenches were also on view, the two latter items being very energetically demonstrated.

The Garlock Packing Co. had a full line of their well-known goods on show, also tube scrapers, etc. The booth was in charge of H. G. Fletcher, manager of the Toronto branch.



H. W. Petrie, Ltd., exhibited three gas engines made by the Keighley Gas & Oil Engine Co., England. All were operating on suction gas, generated in a producer by the same firm. The largest engine was of 65 B.h.p., the others being 30 B.h.p. and 12 B.h.p., respectively. A high-class display of machine tools and accessories added to the further attractiveness of this exhibit.

The Campbell Gas Engine Co., Halifax, England, showed a 25 B.h.p. gas engine running on suction gas, and a 13 B.h.p. engine operating on coal oil with tube ignition. Chambers & Simpson, Bay Street, Toronto, are Canadian agents for these engines.

Bakelite

Valve Discs

One Disc for all Purposes

Replace Soft Discs, Hard Discs and Metal Discs.

NOT till this wonderful new material —BAKELITE—was invented could a composition valve disc be found that would not soften, fuse or crack from moisture, steam or chemicals.

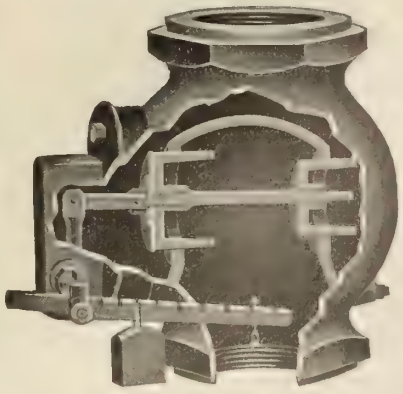
Every engineer knows this.

BAKELITE is the new material which has brought valve troubles to an end.

BAKELITE stands an enormous amount of friction wear.

Your leaking valves with frequent replacement of discs are not necessary. Put in Bakelite Valve Discs and the leaking will cease. This is the only material in the world that embodies in one disc the advantages not only of the usual soft and pliable discs for water but also of the hard and tough composition discs or special metal discs for the hottest steam. They cost less than metal.

Made for all sizes and types of valves.



Ask your dealer or write us.

New Process Noiseless Pinions Are Durable

New Process Pinion taken from a street car motor after fifteen months' service during which the car averaged 105 miles per day.

At the end of the fifteen months' service the teeth had worn down to knife edges, but the pinion still transmitted full load.

Such service on a street car is unusually severe—varying load, bad weather, all kinds of dirt, but the pinion must be thoroughly dependable always.

Of course New Process Pinions wear out, but they do so just like good metal gearing—after a long and useful life.

If you have doubts, just try one in some severe service. *We guarantee satisfaction.* Our engineering advice is free.

Jeffery Correspondence Schools Endorsed

¶ On page 616, August edition of **"The Boilermakers' Journal"** a correspondent, signing himself "By a Brother," after being benefited himself, endorsed Mr. H. S. Jeffery, of the Jeffery Correspondence Schools, as follows:

> One of our brothers is willing to teach you for a low figure, as seen in the advertising pages of this Journal. I am not his agent, have nothing to do with his school, but he has helped me in book learning very much, has thrown all his ability, knowledge and experience an our side when the federal locomotive boiler inspection bill was up for consideration in Congress, and thus if you want to acquire theoretical knowledge I say give him a chance before anyone else. He has the knowledge, ability and experience to help you far more than any professor or mere theoretical man. You want practical knowledge, such as I have given or tried to give you here, and such you will get of our brother, H. S. Jeffery.

¶ **We have a Message to You:** Our Schools will have **Practical Men** to answer your enquiries: **we will not have girls and women, who are paid from $30.00 to $50.00 per month** (as other schools have), to answer inquiries. **Our instructors will be men who have graduated from the ranks.**

¶ Mr. Stationary Engineer and all mechanics, we are going to publish a **great mechanical monthly,** called the **Twenty Century Mechanics.** Here is our offer to the first 5,000 subscribers:

Twenty Century Mechanics for one year	$1.00
One share of common stock in the Jeffery Correspondence Schools, par value	1.00
Membership in the Jeffery Correspondence Schools	1.00
Total	$3.00

¶ **Cut out this advertisement** and mail with $1.00, and you will get the three items listed above. **Act now** or never; this advertisement will not appear again; the offer is good to the first 5,000 subscribers **only.** Address,

FOR LASTING EFFICIENCY

BLISS

BLISS INCLINABLE PRESSES

"Bliss" Inclinable Press No. 21.

They are adapted for nearly all the operations required in the manufacture of tin cans, pieced tinware, metal packages, electrical goods, brass goods, trimmings, etc.

Frame—The design combines the greatest strength and rigidity with convenience for handling dies and material. It can be quickly adjusted from upright to inclined position, facilitating the discharge of work, that will fall off by gravity.

Slide—The slides fitted with positive knock-outs are of unusual length and well gibbed, insuring better work and increased life of tools.

Connection—The connections permit of rapid and accurate adjustments, have long adjustments, and they stay where set.

Shaft—The shafts are forged steel and of ample proportions to stand the heaviest strain without springing.

Clutch—The "Bliss" positive clutch, a powerful and simple clutch, is furnished.

Fly-Wheel—The fly-wheels are of large diameter, bronze bushed and fitted with two locking points.

Adjustments—All adjustments are simple, accurate and convenient.

18 sizes, all in stock—Send for Catalogue No. 1-G describing them, stating requirements.

"WE BUILD PRESSES FOR EVERY PURPOSE."

E. W. BLISS CO., 20 Adams Street, Brooklyn, N.Y.

London Office: 114 Queen Victoria Street, London, E.C., England.

Machinery Wanted and For Sale

FOR SALE.

FOR SALE—Two Goldie-McCulloch Boilers in good repair—length 14 feet, diameter 5 feet, 74 3-inch flues, 70 h.p. GARLOCK PACKING CO., Hamilton, Ont.

BELTING FOR SALE—800,000 feet of best quality leather, rubber, hair and canvas belting, bought from bankrupt manufacturers at 25% to 75% less than the regular value. Also a large quantity of slightly used belting, piping, chains, rails, pulleys, hangers, cotton waste, etc., at very low prices. Send for catalogue. IMPERIAL BELTING AND SUPPLY CO., 5 Queen Street, Montreal.

MACHINERY FOR SALE.

MACHINERY FOR SALE—New and Second-hand Machinery, Engines, Boilers. Wood and Iron Working Machinery and Supplies. Write, stating what you require. Prompt and careful attention to all inquiries. THE ADVANCE MACHINE WORKS CO., Montreal, Que.

PATENTS FOR SALE.

IRON PURIFICATION PROCESS.—Owners of U.S.A. and Canadian Patents of The Johnson Iron Process for producing superior iron castings at low cost, which is a proved success in England, are desirous of disposing of the above Patents or either of them or of granting licences to use the same in U.S.A. and Canada. Full particulars will be supplied to any bona fide applicant by the owners. VERDON CUTTS & HOULT, 87 Fargate, Sheffield, England. (9)

WANTED.

WANTED—Every Power House in Canada to remember that C. E. Shedrick, Craig Street West, Montreal, is still repairing measuring instruments, both switch board and portable. Twenty-five years' experience in repairing all kinds and makes on the market. Intregating meters repaired, tested and sealed, and returned on quick time. (12y)

SITUATION VACANT.

FOREMAN WANTED—For machine shop doing special manufacturing, employing about 35 men. Must be energetic and thoroughly competent to get out work, both in quantity and quality, to lead off on work and handle men to advantage. In answering, give full particulars, experience, ability, married or single, and salary expected. Address Box 112, CANADIAN MACHINERY, Toronto. (9)

WANTED—Engineer with good practical experience in all classes of interior lighting and motor installation. Special duties revising rules and regulations. An engineer with English and European experience preferred. HYDRO-ELECTRIC POWER COMMISSION, Continental Life Building, Toronto. (9)

POSITIONS WANTED.

FOUNDRY SUPERINTENDENT OR FOREMAN is open for position. Up-to-date in general foundry practice, chemical analysis, molding machines, also automoblie castings. Can give results. Apply Box 115, CANADIAN MACHINERY, Toronto

FOREMAN DIE AND TOOL MAKER, experienced in handling men in die and tool room, thorough knowledge of manufacturing and plating department, brass fixtures and stamped work. Apply Box 113, CANADIAN MACHINERY, Toronto.

POSITION WANTED—Executive position. One with broad experience in factory efficiency, up-to-date methods, ability, and a good organiser. Wishes to correspond with parties. Box 114, CANADIAN MACHINERY, Toronto. (9)

MISCELLANEOUS.

A BOOK-KEEPING STAFF IN ITSELF—doing the work with machine-precision and accuracy, the National Cash Register. Write us for demonstration literature. National Cash Register Co., 285 Yonge St., Toronto.

COPELAND-CHATTERSON SYSTEMS—Short, simple. Adapted to all classes of business. Copeland-Chatterson Co., Limited, Toronto and Ottawa. (tf)

COUNTER CHECK BOOKS—Write us to-day for samples. We are manufacturers of the famous SURETY NON-SMUT duplicating and triplicating Counter Check Books, and Single Carbon Pads in all varieties. Dominion Register Co., Ltd., Toronto.

DOUBLE YOUR FLOOR SPACE. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

ELLIOTT-FISHER STANDARD WRITING-ADDING MACHINES make toil easier. Elliot-Fisher, Limited, Room 314, Stair Building, Toronto.

FIRE INSURANCE. Insure in the HARTFORD. Agencies everywhere in Canada. (tf)

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St West, Toronto. (tf)

MR. BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated," Stratford, Ont.

WAREHOUSE and Factory Heating Systems. Taylor-Forbes Company, Limited. Supplied by the trade throughout Canada. (tf)

MISCELLANEOUS.

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. Send us samples of what you are using—we will send you prices that will interest you. Business Systems, Limited, Manufacturing Stationers, Toronto. (tf)

THE "Kalamazoo" Loose Leaf Binder is the only binder that will hold just as many sheets as you actually require and no more. The back is flexible, writing surface flat, alignment perfect. No exposed metal parts or complicated mechanism. Write for booklet. Warwick Bros. & Rutter, Ltd., King and Spadina, Toronto.

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands 77-79 Queen Street East, Toronto, Ont. (tf)

Keep in mind the dominant fact that mankind from its first appearance on the earth has been schooled by nature to look for signs; for invitations to taste; for suggestions as to what to wear. Tell your story briefly, forcibly, truthfully, and address it through the proper media and you can successfully apply advertising as a means to increased distribution.

FREE INSTRUCTION BOOK

SEND FOR IT TO-DAY

This book should be within instant reach of every engineer. It tells clearly, by photograph and formula, how to use the well-known Smooth-On Iron Cements in repairing boilers, engines, castings, tanks, joints, etc.

Used according to instructions, Smooth-On Cements will save more actual time and money in the engine and boiler room than any single product manufactured. Their uses are innumerable, and their repairs absolutely permanent.

Carborundum Grinding Wheels

Are the Wheels of To-day and To-morrow

IN hundreds of shops, under innumerable conditions, Carborundum wheels are to-day proving their ability and economy. They will do the same thing to-morrow, and as long as prudent grinders realize the value of the wheels that do more work, better work and last longer. As evidence: the cylindrical grinding of 40 to 50 pieces of 20 point carbon steel tubing, 2 feet long, 4½ inches diameter, in a day, at a Pennsylvania plant. A 16-inch Carborundum wheel does the work—gives a splendid finish—cuts fast—stands up to the task. 30 pieces with an inferior finish was all they ever got with the best of other wheels. This is just an ***every day*** evidence of the superiority of Carborundum.

¶ Don't handicap your men or increase your production cost with poor wheels. Let us help you get the right wheel in the right place. Write us.

A GOLD MINE

SAVE YOUR IRON

SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

The Making of Hollow Castings

The recent introduction of King Kore Kompound has now rendered this, once somewhat difficult, part of Foundry practice comparatively easy.

It has, also, reduced the core expense by more than one-half.

This compound is a black, dry powder, and is used as flour is used, but with one-half the quantity is produced greater and better results.

Its use avoids the danger of swelling or "blowing." The core easily comes out of the casting, and when old cores are ground up, in the rattler, or otherwise, the sand so made is used over again.

The core compound it contains, again becomes a binder under heat of the core oven, as it melts, and so it is used over and over again.

This is Foundry Economy; Flour, Rosin, etc., are now luxuries.

A barrel of King Kore Kompound will be sent "subject to approval" to any inquiring mind.

That is the **Stevens' System** of trying before buying.

I have copies of proportions of compound to sand used and methods followed in core rooms of Foundries in thirteen different States. This information, with other printed matter relative to the subject, will be mailed on request.

I maintain a direct branch at 137 Jarvis St., Mr. J. M. Mayers, Manager, Toronto, Ont., where is stocked a supply of **Foundry Facings, Foundry Supplies, Buffing Compositions,** of my own manufacture.

The stamp of quality pervades them all.

LAFFITTE
Brazing Plates

No. 1
For Brazing Brass, Red Copper & Bronze

No. 2
For Brazing Red Copper and Iron

No. 3
For Brazing Iron and Steel

These three contain all the necessary ingredients for a perfect braze, including a great proportion of copper solder.
As they melt at different heats it enables the brazier to have a solder which fuses at a lower heat than the metal being brazed.
Does quicker, cleaner, better work. No swelling or blistering.
Leaves braze free from oxides and residue ready to finish.

SAMPLES FREE on request.

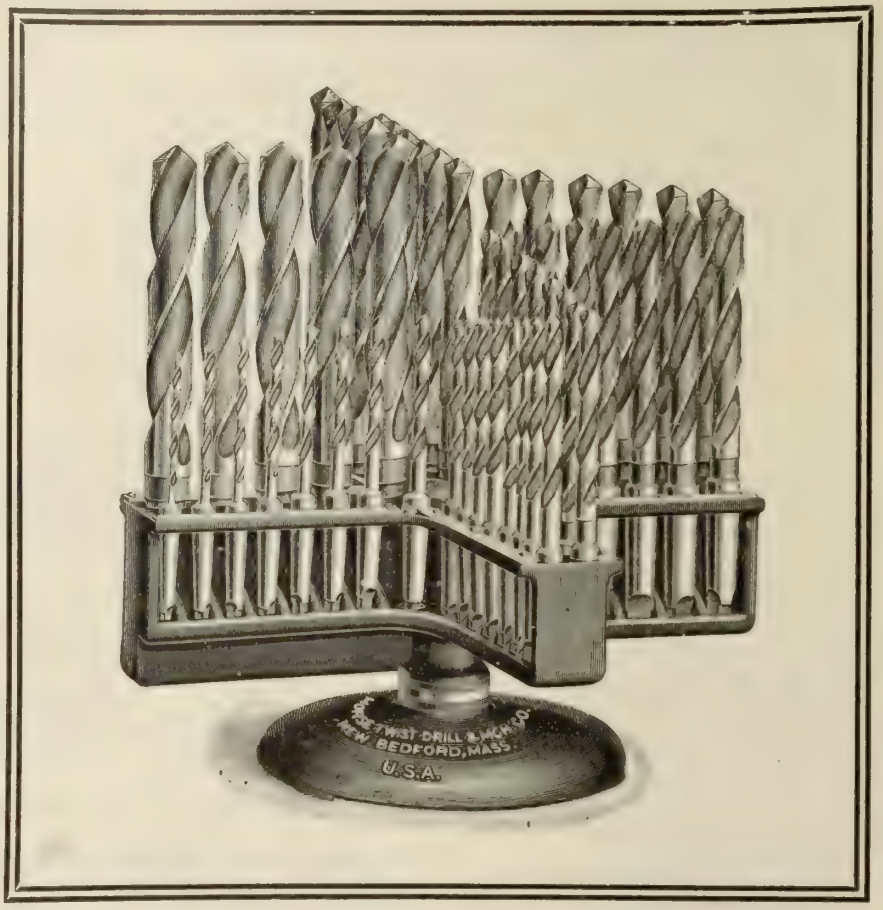
Canadian Machinery

A Stronger and Neater Job for Half the Money

The electric current fuses and melts the metal at one little spot under the points of the copper dies. **It's done as quickly as electricity can go through the metal.**

Send us a sample of your work; we will weld it for you and tell you what it will cost you to weld the same pieces by the thousand. You can then figure out whether it will pay to buy a welder or not.



Our specialty is manufacturing welding machines for Butt welding or Spot welding anything that's weldable. Our catalogue tells about them and it's yours for the asking.

NO LEASE NO LICENSE NO ROYALTY.

THE TOLEDO ELECTRIC WELDER COMPANY

CUMMINSVILLE, - CINCINNATI, OHIO

"MORSE"

Twist Drills

Reamers, Cutters, Etc.

of Carbon and High Speed Steel.

Convince yourself. A trial is a speedy, logical, convincing, clinching argument to use them in your shop.

Morse Twist Drill and Machine Co.

New Bedford, Mass., U.S.A.

CANADIAN MACHINERY BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any machinery or power equipment.
You will often get information that will save you money.
To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.
To Non-Advertisers—A nominal rate of $1 per line a year is charged non-advertisers.

CLEVELAND

MAKES WORLD'S DRILLING RECORD

At the June Convention of the Railway Master Mechanics and Master Car Builders Associations at Atlantic City, the highest point in drilling efficiency that machine shop practice has ever known was attained by a stock 1 1/4" Paragon Flatwist High Speed Drill in successfully removing 70.55 cubic inches of cast iron in one minute, repeatedly cutting through a heavy billet at the record-breaking rate of

57½ Inches—Almost 5 Feet—Per Minute

This 1 1/4" drill ran at 575 revolutions per minute with 1/10 (.100) inch feed per revolution, successfully withstanding the terrific strain of this extreme speed and feed. Before attaining this maximum performance, which was approached gradually, numerous other "Cleveland" Drills were put through at the rates of 33, 35 and 47 1/2 inches per minute. In no case was the limit of strength of the drills reached, but the speed of 57 1/2 inches per minute could not be exceeded on account of the inadequate capacity of the electric feed wires which brought current to the motor driving the drill press.

Facsimile of the bulletin which gave the first detailed announcement of the results to the numerous interested spectators.

There can be but One Logical Conclusion That Will Interest the User of Drills—"Cleveland" Materials — "Cleveland" Workmanship — "Cleveland" Heat Treatment—**Must be right.**

Although drilling at such a speed is not to be recommended as economical shop practice, and can only be accomplished under ideal conditions, such as—absolute rigidity in the machine, uniform and sufficient driving power, solid clamping of the work, perfect grinding of the tool, and the most expert handling—yet this extremely severe test proves conclusively the unequaled durability and reserve efficiency of "Cleveland" Twist Drills.

A practical test of "Cleveland" Drills, under your own shop conditions, will involve no obligations and may mean a valuable increase in drilling efficiency for you.

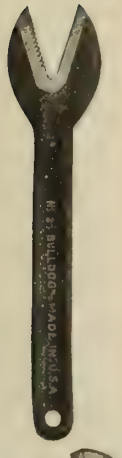
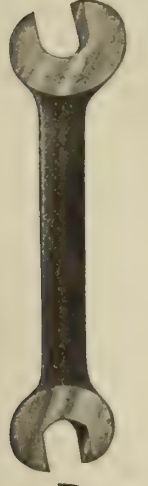
"W&B" Wrenches are Superior to All Others



☐ Their **Superiority cannot be measured in per cents,** since there is **but one standard or average** by which comparison can be made, and that is **the "W & B" standard.**

There are no freak **"W & B"** Wrenches. One is just as good as another, and they are all good wrenches.

Users of **"W & B" Diamond Trade-Marked Wrenches** appreciate the gain measured to them in **wrench economy.** The return is gain in **dollars and cents,** not in speculative per cents.



Students of Tool Economy appreciate **careful inspection** of the character maintained by us. **More wrenches** and of a greater variety are produced by us than by any other manufacturer.

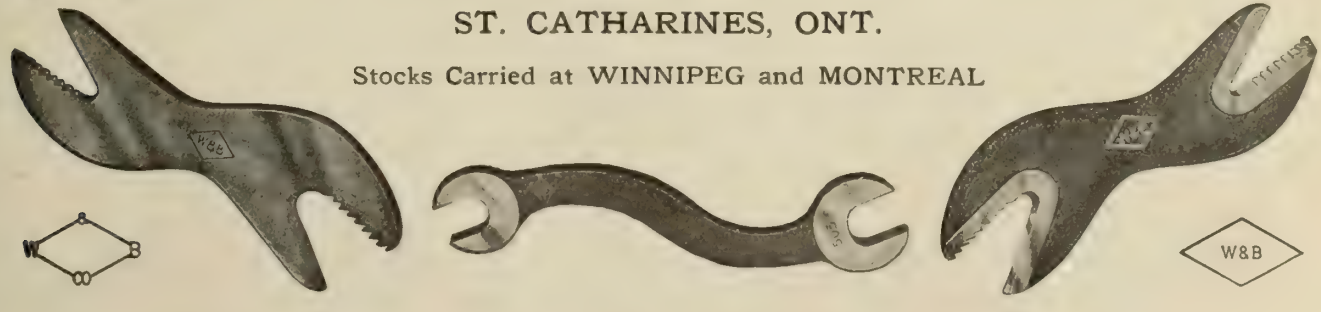
MACHINISTS' KNIFE HANDLE, AGRICULTURAL, BULL DOG (ALLIGATOR TYPE), RAILROAD, RAILROAD SPECIAL, ENGINEERS', ALWAYS READY, CONSTRUCTION AND CAR BUILDERS', AUTOMOBILE, GENERAL PURPOSE WRENCHES, ETC.

All Steel and Drop Forged Wrenches, all styles.

We can furnish the Consumer a **complete line** of his wrench requirements in a single shipment.

Why Divide Your Orders?

Save Freight and Time



Have them shipped all at once from the nearest point. Jobbers in all large cities will furnish **"W & B" Trade-Marked Wrenches. Accept no substitutes.** Ask for catalog No. 75 C, or write us.

B & S Cutter Testing Fixture

When your gear or formed cutters are sharpened they must be ground with the tooth faces radial or the work which they do will not be satisfactory.

This fixture is designed to accurately test the cutters in this particular. After the cutter has been ground it is mounted on the stud and the faces of the teeth are turned so that they rest, one after the other, on the testing plate which is radial to the stud. When the whole contour of the tooth touches the plate simultaneously the tooth faces are radial.

MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty

BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery —in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Wire of every description for Slugger and Standard Screw Machines.

The Canadian General & Shoe Machinery Company, Ltd.

ERNEST CARON, Managing Director

LEVIS, Quebec

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

118 Esplanade East, - TORONTO

FIRE BRICK *for* Cupolas

¶ The standard Fire Clays by which all other Clays are judged are those of Pennsylvania.

¶ They're the ones from which our Cupola Brick are made.

¶ The cost per thousand means nothing unless you know the results the Brick are giving.

¶ Write us for definite examples of how our material affects your melting costs.

Why Don't YOU Find Out All About This New McDougall Gap Lathe? A Little Investigation Will Convince You of Its Intrinsic Merit. It Will Save You or Any Other Machine Shop Owner Much Money by Turning Out Work Faster and Easier. Every Article Will be Accurate to the Least Fraction. Investigate. Don't Delay. You are Losing Money if You Do.

DESCRIPTION

Headstock construction prevents chattering, and deep oil chambers fitted with ring oilers make spindles and bearings self-oiling and always well lubricated.

Tailstock of a special type, and sleeve is clamped by a quick acting locking device. Tailstock is secured to bed by bolts adjusted from the top where they are easily accessible.

Bed, non-springing and webbed, and braced to secure rigidity.

Gap, vibration absolutely prevented by use of brace supports to carriage.

Spindle, high carbon hammered steel in solid chilled cast iron bearings, accurately fitted and self oiling.

Carriage and Apron, non-springing under severest strain, full "V" bearings and flat bearings in addition on front ways.

Double Back Gears give eighteen distinct spindle speeds, suiting lathe to work on widely different diameters.

Compound Rest, with graduated base, accurately fitted taper gibs, end adjusted. Screws in both rest and cross slide read to thousandths.

Friction, Safety Feeds, screw and rod feeds cannot be both engaged at the same time. Quick changes of 1¼, 2½ and 5 times thread being cut.

Gears and Racks, cut from solid and steel where necessary.

Screw Cutting, full range of commercial threads provided for.

Equipment, Compound rest, steady rest, follow rest, large and small face plates, wrenches, two-speed, friction countershaft furnished with each lathe.

Accuracy, Strength, Solidity, Wear. These are the paramount features behind all McDougall Machines. Made **to meet extreme demands.**

Of Exceptional Rigidity, Real Convenience, Great Power

The NILES BORING and TURNING MILLS

The results of over fifty years' experience are embodied in the design of the Niles Mills. Particular attention has been given to details that make for continued accuracy and the greatest convenience in handling.

Table rests on a wide flat annular bearing, which has no tendency to wedge under heavy cuts or to lift the table under side cuts, which is the difficulty with the usual V bearing. Table spindle runs in a straight bushing, tapered on the outside for taking up wear. This construction ensures the continued alignment of table and differs from the usual construction of the tapered spindle where with wear any defect in the taper will change the alignment of table. A lower step bearing running in oil enables the table to be raised off its annular bearing when running at high speed.

12 ft. Heavy Pattern Niles Boring and Turning Mills

Each head has independent positive gear feeds, operated horizontally on the saddle and vertically or angularly on the bar. Tool bars are octagonal in section with four sides scraped to a bearing in their swings, offering the strongest possible section and ability to enter comparatively small holes when boring. Cross rail has power elevating gear.

The many good features of the Niles Mills, their exceptionally rigid construction and numerous minor details are fully described in the catalog "Niles Boring Mills." Write for a copy.

For Quality and Convenience
The
"Bemis & Call"
Combination Wrench

stands in a class by itself.

Has been endorsed by first-class mechanics as the "best ever" for either pipe or nut work.

By doing the work of two ordinary devices it means the saving of much time and money.

The "BEMIS & CALL" Combination Wrench is made from material that has been selected by experts, head bar and shank being a one-piece forging.

It is thoroughly case hardened, and all parts are interchangeable.

Send for our complete illustrated catalogue on wrenches.

Traders Bank Bldg.	52 Victoria Square	Telephone Bldg.	158 Portage Ave. E.	311 8th Ave. West	439 Pender Street

Cost Reducing Features

An indestructible spindle bearing made of hardened steel and cast iron.

A head construction that gives more effective pulling power at the spindle than any other lathe built.

A patent "compensating V" that permits four times the bearing area between the carriage and bed found on other lathes.

A carriage in which the tool thrust is taken on a bearing the entire length of the carriage, and which positively will not climb the V.

A double-walled one-piece apron which will last as long as the rest of the lathe.

A quick change gear complete in one unit, giving thirty-six changes with two operating levers.

An offset compound rest which can be used without skinning the operator's knuckles.

The centres set back of the middle of the bed, giving greater swing over carriage and permitting the turning of work up to the maximum swing without the tool overhanging the bed.

Cincinnati Handiness

WHEN you have a job of end or face milling to do on a Horizontal Miller, don't you find it hard to operate the feed lever and at the same time keep your eye on the cutter? That's because the machines you are using can be operated from only one place. Our new High Power Machines have an additional feed lever at the side of the knee.

The operator can stand close up to his work, with the cutter in full view, and control the machine from this position.

With this one lever he can operate and reverse table, cross or vertical feeds.

The main starting lever is immediately in front of him and the speed and feed changers are at his elbow, so that the entire machine is under complete control from here.

Nothing Lacking in a B. & K. Pipe Machine

And not a single useless or complicated accessory in the whole make-up. The Bignall & Keeler line of machines is built for rapid, accurate and economical pipe cutting and threading. They are designed for this work, up-to-date, adapted for varying needs and fitted accordingly. If a certain machine needs **two** gripping chucks for the most advantageous operation —we put on two chucks. If but **one** is needed, it's a case of one. If a motor drive is desired the motor can be easily mounted and attached. The dies, gripping chucks, etc., used in B. & K. machines are of the most approved types, and strength and durability are conspicuous features.

Write for catalogue—our line is very complete.

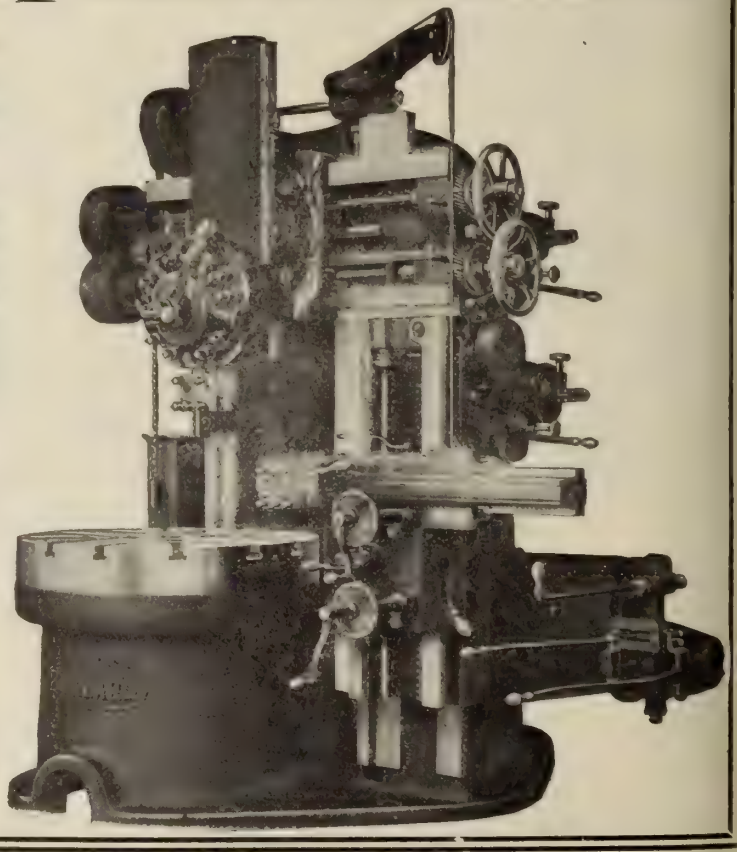
Save On The Single Piece As Well As The Big Job

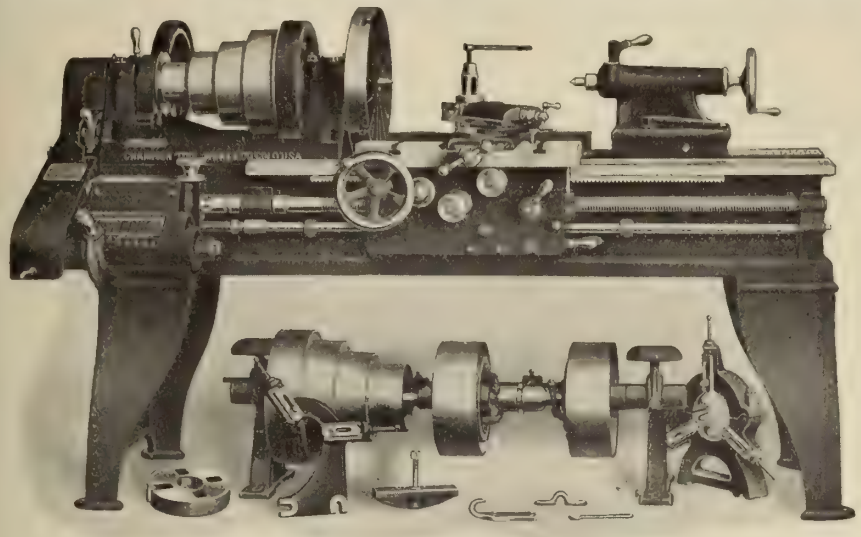


The Bullard Vertical Turret Lathe is not alone a manufacturing machine—the very features which make it a good manufacturing machine also reduce the cost of the individual piece.

The Vertical Turret Lathe is ready to save on face plate work of every description within its capacity. Vertical Construction, Ample Power and Rigidity, Multi-Cutting, Quick Speed Change, Centralized Control, Automatic Lubrication these cost-reducing factors save on the single piece as well as on the big job. It does not keep the foreman on the jump looking for the right job. Nor does it require an expensive special tool equipment for each job.

Investigate. Find out how much less YOUR face plate work will cost done on a Vertical Turret Lathe.

We'll be glad to put some interesting facts and figures before you.



Send for Treatise on Face Plate Work, No. C-15, NOW.

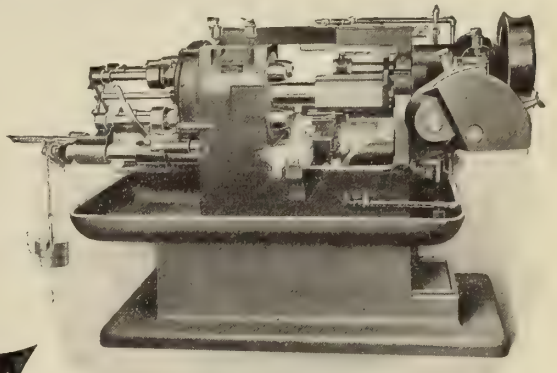
The Gridley Automatic Turret Lathe

Will Increase Your Output and Reduce Your Labor Expenses



The Gridley is not an ordinary automatic, because in addition to handling any bar of metal within its capacity that can be made on any automatic, it handles work of greater length and of more complex character than other machines of this kind.

A saving of time and money will always result from the use of Gridley Automatics, as one operator can attend to several machines at once, and can use tools tandem on each machine when rapid production is necessary. On all other automatics there is an over-hang of the tool This overhang prevents the performance of accurate work, because the method of supporting tools does not permit as heavy cuts or as coarse feeds.

GRIDLEY Automatics are the assurance of accuracy and economical service. Write us for illustrated catalog and particulars—the GRIDLEY is worth investigating.

We manufacture both Multiple Spindle and Single Spindle Automatics.

Sibley Machine Tool Co. Church Lane SOUTH BEND, Ind., U.S.A.

MUELLER RADIAL DRILLS

COLUMN. Patented Stationary column insures perfect rigidity, eliminates vibration, and prevents springing of the arm. This is one of the most valuable features of the MUELLER Radial Drill.

ARM is made in pipe section, and when clamped to the column it has the same resisting power as it would have if column and arm were one piece. This means no spring to the arm.

FEED. We have a combination Positive and Friction feed and arrange for eight changes of feed. All changes can be made while the drill is at work.

TAPPING MECHANISM. Our combination low and high speed reverse for backing taps out is something entirely new. It has made possible unheard of reductions in tapping costs.

CONSTRUCTION. The construction of our drill is extremely simple. All operating levers are located directly in front of the operator.

We can arrange our machine with speed-box, motor drive, and can furnish any style of table.

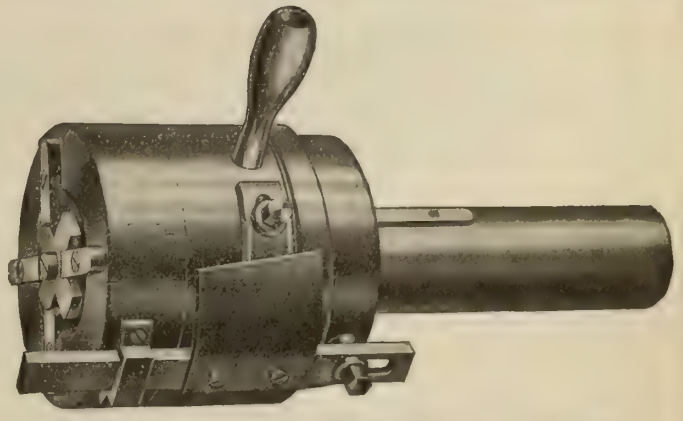
PIPE THREADING MACHINES

Our No. 18, Duplex Improved, equipped with Peerless Die Head mechanism.

Capacity 8 in. to 18 in., either belt or motor drive.



Write us for prices on various sizes from 1/8 in. to 18 in. Also single and double head rapid nipple machines.

John H. Hall & Sons,

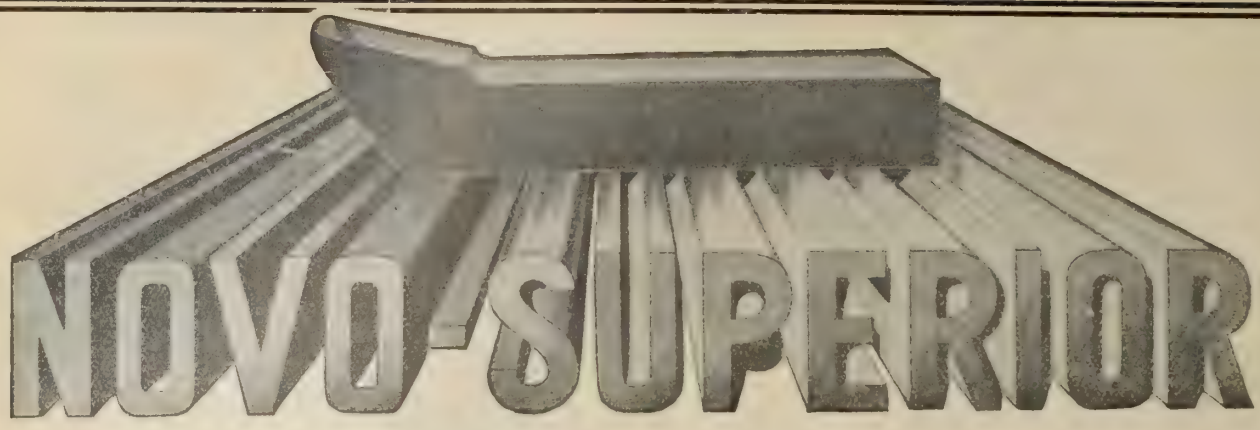
BRANTFORD, CANADA

No More Power is Necessary

for cutting a taper thread than for a straight thread of equal diameter, where the GEOMETRIC TAPER THREADING DIE HEAD is used. One of these Die Heads fitted to your Screw Machine or Turret Lathe will give you accurate taper threads at slight cost. Can handle any range of taper threading work.

GEOMETRIC TAPER THREADING DIE HEAD

Far better than a Special Machine, for it leaves you the Screw Machine for other work when not cutting tapers.



These Die Heads are successfully cutting the taper threads in Locomotive Wash-Out or Mud Plugs, Corporation Cocks, Beer Cocks, Special Faucets, etc.

Let us get in touch with you. Tell US your requirements.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

Nicholson-Made Files

Are the Choice of Skilled Mechanics Who Demand a First-Class File

One trial is enough to convince any mechanic that the Nicholson-Made File cannot be excelled in quality or temper.

With it a man can save time and money, for the reason that its cutting quality and special temper allow more work to be done in a given time than with any other file.

Special made steel, special machinery, special methods, and specially trained men account for Nicholson-Made File superiority.

Every buyer gets intrinsic value for the money invested.

ASK YOUR JOBBER FOR THEM.

NEW HIGH-SPEED STEEL

Engineers now have the opportunity of using a much more durable Steel than the best High-Speed Steel hitherto used, and this they will find in our

Allen's IMPERIAL Special (The new improved) High-Speed Steel

which may be either air-hardened, oil-hardened or water-hardened.

This *Imperial* Special Steel will cut much harder materials than can be cut with Tools made of ordinary best High-Speed Steel, and heavier cuts may be taken, or Machines may be driven at accelerated speeds when (in either case) it is found economical to do so. *Imperial* Special will also wear much longer than ordinary best High-Speed Steel before requiring to be re-ground.

IF YOU WANT A BETTER QUALITY OF STEEL than that you now use, we shall be glad to receive your orders for our

Allen's IMPERIAL Special (The new improved) High-Speed Steel

The Simple Adjustment

of the Starrett Micrometers is a feature that enthuses all mechanics. It takes up any wear quickly and accurately—not by the trial, hit-and-miss way of the movable anvil. This is obtained by placing over the barrel a thin, graduated sleeve, which carries the base or zero line, instead of having it marked on the barrel itself. If at any time, on account of excessive wear, the zero line is not correct, a small turn of this sleeve with a small spanner wrench will remedy the error. The spanner wrench is sent with the Micrometer.

When you see any Starrett Tool you will notice some little difference which makes it better—which makes the Starrett Tools known and trusted wherever accurate work is done.

Catalog 193 is free. It tells of and illustrates all the fine Starrett Tools.

"CROWN"
SAND RAMMERS

The following figures show the result of some observations made in representative foundries all over the country. They are not merely "test" figures, but show what can be accomplished with the "CROWN" Sand Rammer under every-day working conditions:

Size of Cope	Time in Peining and Ramming		Ratio of Reduction	Per Cent. of Time Saved
	By Hand	By Sand Rammer		
12 ft. x 18 in x 4 in.....	5 min.	1 min.	1 to 5	80
12 ft. x 18 in. x 10 in.....	10 min.	1½ min.	1 to 6.6	85
6 ft. x 3 ft. x 6 in.....	20 min.	3 min.	1 to 6.6	85
7 ft. x 3 ft. x 12 in.....	1 hour 30 min.	16 min.	1 to 5.6	82
15 ft. x 30 in. x 16 in.....	2 hours	27 min.	1 to 4.4	77
19 ft. x 90 in. x 15 in.....	8 hours	1 hour 30 min.	1 to 5.3	81

It is to be especialiy noted that these figures include not only the final ramming, but the most careful peining as well; and the total time covers the completed job.

They are light, of convenient length, operate freely and consume but very little air.

Made for Bench and Floor Work. ***Descriptive Pamphlet 8108***

Has Your Factory Plenty of Light and Fresh Air?

That these are *absolute necessities* in modern factory and office buildings no man who has a shred of progressiveness in his make-up can argue.

Poor daylight and insufficient ventilation mean tired employees, short days, big lighting bills and decreased output.

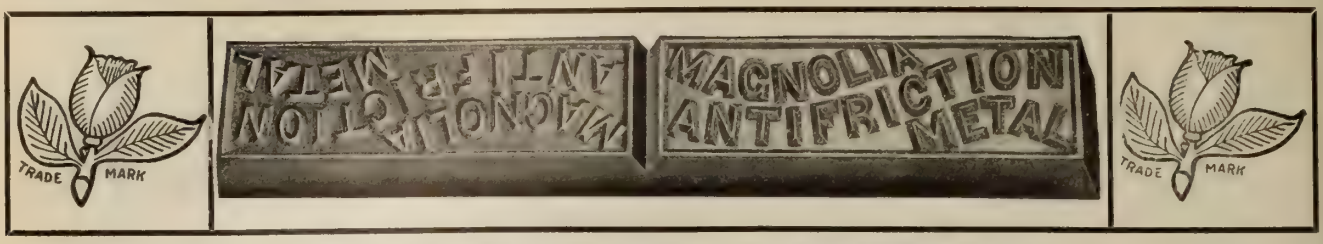
Yet the ordinary wood sash for factory buildings, if of sufficient size, is so heavy and clumsy in structure that it is not only very *expensive* but *obstructs a large part of the lighting area*, and the difficulty of opening it, particularly in cold or damp weather, prevents proper ventilation.

"Fenestra" Solid Steel Sash

is a light, strong steel frame and sash combined, admitting from 25 to 40 per cent. more light through an opening than wood sash.

Not only does it increase the effective lighting area by occupying less space itself, but, because of its almost unlimited resistance to wind-pressure, windows may be built of it in almost any size.

"Fenestra" Sash encourages your employees to properly ventilate their work-rooms by making it easy and handy to open and close the ventilators. "Fenestra" ventilators do not swell in damp weather nor freeze up in winter. Replace the foul air and the smoke and gas-laden atmosphere in your factory with fresh air, give your employees plenty of daylight and watch the effect on your output and lighting expenses.



Bear in mind, also, that "Fenestra" Sash are *fireproof* and materially lower insurance rates.

They are made in any size or shape, and are always built to supply individual needs.

If you are planning or erecting an industrial building of any kind that you intend to make permanent let us send you our "Fenestra" catalogue. A post card brings it to your desk. Address "Steel Sash Branch."

AHEAD AND REVERSE

In one of our recent advertisements showing friction test of MAGNOLIA METAL by the United States Government, using water as a lubricant, you may not have noticed that this test was made both "ahead and reverse."

This word "reverse" is small and inconspicuous and very easily overlooked, but the fact that the engineer officers of the Navy made the test in both directions, shows how important and necessary they considered it in arriving at their determinations.

We believe that it is not generally known that very few babbitt metals will stand reversing, even with oil lubrication, as they rough up on the reverse test like plush rubbed the wrong way.

The fact that MAGNOLIA will stand this test with water lubrication is a wonderful tribute to its anti-friction qualities.

MAGNOLIA, above all other metals, conditions the shaft and bearing very quickly—imparting to both smooth highly-polished surfaces—and then settles down for a long cool run on the minimum quantity of lubrication.

This reverse test speaks volumes in favor of MAGNOLIA.

OILDAG

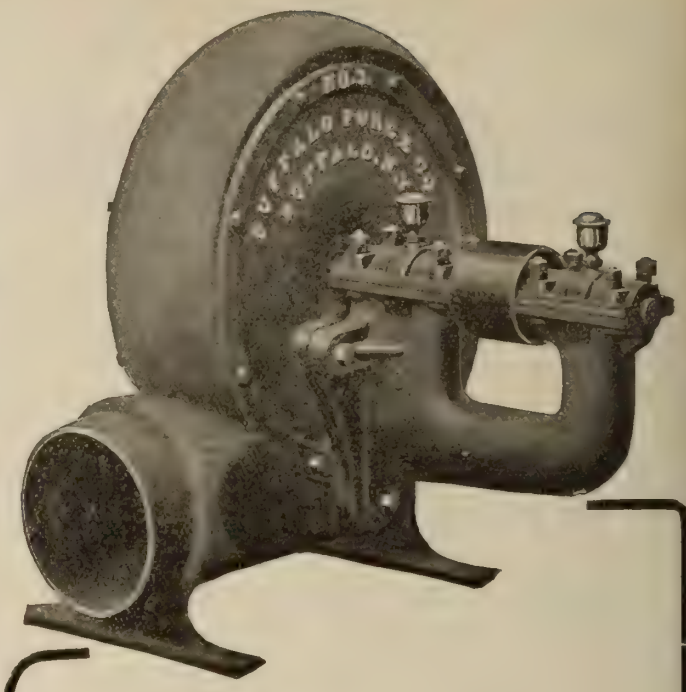
(Registered Trade Mark)
Deflocculated Acheson-Graphite, Dag and Oil.

Made in Canada.

Graphite does not dissolve in any liquid or break under pressure, and these qualities, added to the unctious softness and purity, together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes.

The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 40,000 meshes per square inch, and sub-divides each grain of this finest powder into many still smaller particles—so small that they cannot be seen through a strong microscope.

Oildag is this deflocculated Acheson-graphite suspended in oil, where it neither floats or sinks, but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.



Mr. Robert A. Ross, E.E., of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. **This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in superheated steam practice."**

Write for Oildag Booklet 77D.

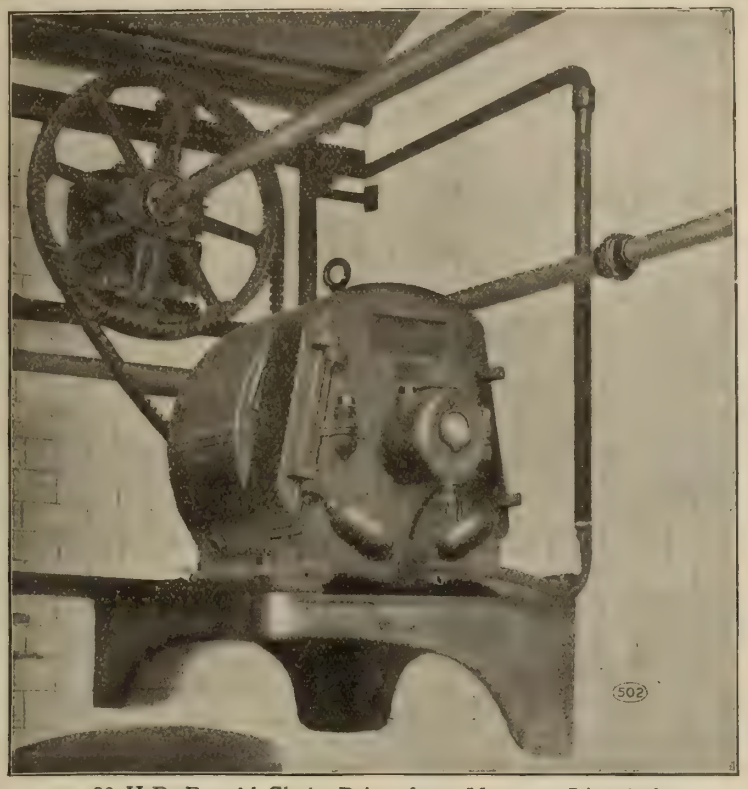
Buffalo "B" Volume Exhausters

have a decided advantage over the usual type in the solid, one-piece peripheral shell.

Not only is this construction very rugged and strong, but the absence of joints under pressure in the shell prevents leakage of air and waste of power. The blast wheel is strongly built, accurately balanced, and, together with the extra long oil-ring bearings insures smooth, easy and quiet operation.

BUFFALO EXHAUSTERS are especially adapted for handling dust and refuse from emery and buffing wheels and tumbling barrels; and smoke, gases and fumes generally. You can always depend on efficient, reliable operation.



A wide range of sizes and capacities make it easy for you to select just the one for your requirements. Ask for catalog 178-LD and prices.

PUMPS

The superior excellence and splendid results shown by

"FAIRBANKS-MORSE"

pumping machinery are largely due to the fact that for many years we have manufactured Hydraulic Machinery of all descriptions. We are therefore able to build pumps which are properly designed and adapted to every-day use. This is of the greatest importance in a first-class pump, for the usefulness of an engine may be lost if the pumping machine is badly designed.

You will get all these important features when you purchase a "FAIRBANKS-MORSE" pump.

Let us solve your pump problems.

The Canada Steel Co. Rail-Carbon-Steel Rolling Mill

By J. H. Williams*

Being a brief illustrated description of one of the more recent additions to the many industries now located in Hamilton, Ont., and Which Has for Its Purpose the Turning to Further Service in Other Fields of Selected Old Steel Rails.

FOR the past fifteen years rail-carbon steel has been meeting with much success in the United States, and a plant for its production has now been started in Canada. The Canada Steel Co., Ltd., are located at Hamilton, Ont., and the output of their mill consists entirely of steel of the above grade, rolled from selected old steel rails having a carbon content of about .40.

Such a product has its well defined uses, and for certain purposes is superior to ordinary mild steel. Thus, for agricultural implements, bedstead angles, telephone line material and other construction purposes calling for lightness combined with stiffness and strength, rail-carbon steel can be used with considerable economy. Its elastic limit is about 50,000 lbs., and its ultimate tense strength about 85,000 lbs. per square inch. Again, the high elastic limit claimed makes it particularly valuable for reinforcing concrete. As compared with mild or medium steel having an elastic limit of from 30,000 to 35,000 pounds, rail-carbon steel will give greater reinforcing strength, or a smaller quantity can be used to give an equivalent result.

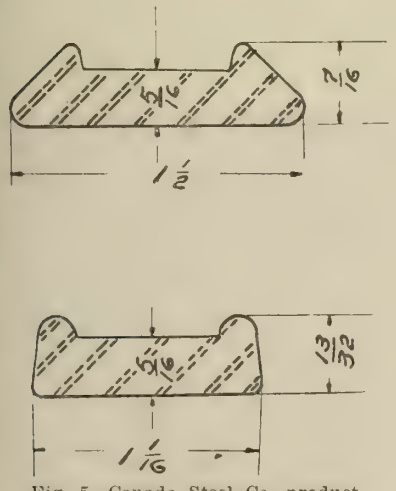

Fig. 5—Canada Steel Co. product.

Fig. 1—Canada Steel Co. rail yard and shops.

Description of Plant.

The plant, situated on about six acres of land, is served by both the Grand Trunk and the Toronto, Hamilton and Buffalo Railways. Old steel rails, purchased from roads in Canada and the States, are received at the west end of the yard, Fig. 1, and there stored. As a first step in the process of manufacture of the new products, they are broken by hand labor only into 7½ and 11 feet lengths, the flange being nicked with a a cold set, following which half a dozen good blows of the hammer serve to make a clean break. The rail is turned after every second blow, and needless to say there is a certain knack required to break it clean. Men at this job are on piece work, and make $3 to $3.50 a day.

The Furnace.

After being broken, the rails pass to a continuous heating furnace heated by coal and 40 feet long by 12 feet 6 inches wide. A noticeable feature of the mill is that no steam whatever is used for any purpose. The furnace ash pits are water sealed, and the dropping of the hot ashes into the water generates sufficient steam vapor to soften the clinker on the grate bars. Many mills use boiler steam for this purpose. Draft is supplied to the furnace by a 36-inch Sheldon belt-driven fan operated by motor.

The rail is pushed into the coolest end of the furnace by an electrically driven pusher. This is shown in Fig. 2, from which it will be seen that the rail en-

*Associate Editor.

Fig. 2—Canada Steel Co. rail feeder and furnace.

Fig. 3—Canada Steel Co., rolls equipment.

ters crossways. Each advance of the pusher moves forward all the rails in the furnace by a distance equal to the

Fig. 6—Canada Steel Co. product finishing department.

pusher's stroke, and by the time they have reached the other end they are at the proper heat for rolling.

The Rolling Mill.

This consists of six sets of 12 inch three-high housings, and one set of two-high housings, making a seven stand mill, as shown in Fig. 3. The rail is brought from the furnace by means of a "telegraph" or traveller. The first pass through the rolls splits it into three pieces, head, web and flange—see Fig. 4. Each part is then picked up, and passed

Fig. 4—Canada Steel Co., rail stock in process of re-manufacture.

back and forth through the various sets of rolls and made into finished bars at one heat. The head of the rail is rolled into rounds, squares and flats, while the web and flange are mostly used for angles, flats, agricultural shapes, etc. The company makes a specialty of sleigh shoes, sections of which are shown in Fig. 5. Rail-carbon steel forms an ideal material for this purpose and large quantities of these sections are rolled.

Further Equipment.

The furnace and rolls are located at the west end of the mill, while at the east end are located two power shears, one set of straightening rolls for angles and flats, and two twisting machines for twisting the square bars used for reinforcing concrete. Fig. 6 shows this end of the shop. The production of the mill varies of course with the demand. As many as 55 tons of finished bars have been produced in 11 hours, which must be considered a very creditable performance when it is remembered that the mill only began operation on May 1st of this year, and has consequently hardly yet got into its stride.

The Drive.

A Canadian General Electric Co. A.C. motor of 500 h.p. drives the rolls by con-

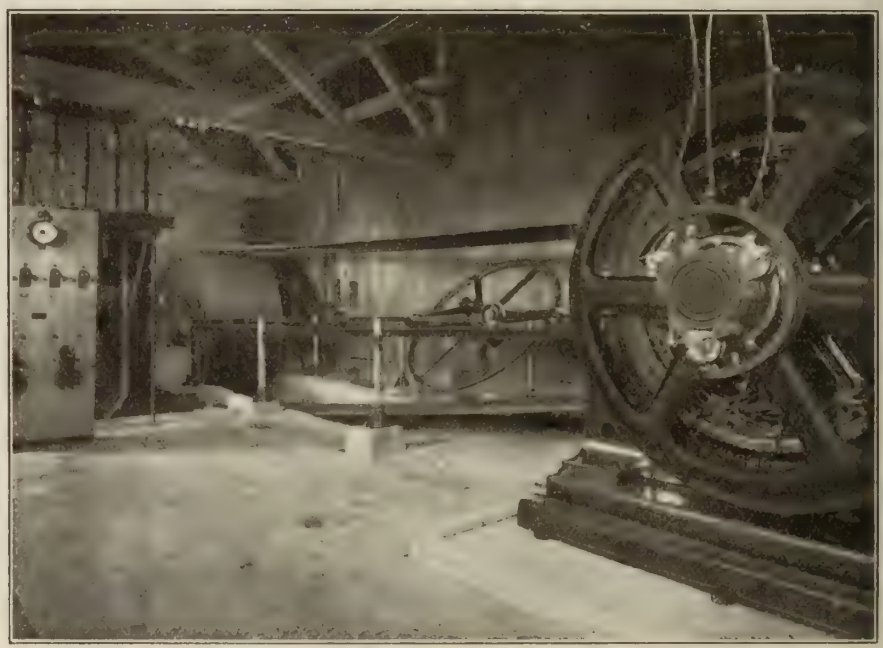

Fig. 7—Canada Steel Co. power equipment.

FIG. 8—CANADA STEEL CO. PLANT, HAMILTON, ONT.

tinuous rope drive, as shown in Fig. 7. The rope is 1¼ inch Manilla and takes 28 turns round the pulleys, the latter being spaced at 30 feet centres. The tension is taken up in the usual way by a pulley on a travelling carriage controlled by cheese weights. The motor runs at 425 r.p.m. and the mill at 180 r.p.m.

Machine Shop.

In the machine shop attached to the plant, the rolls are turned and general repairs made to the various machines.

Its equipment consists of one 18 inch engine lathe, one 18 inch drill press, one 16 inch shaper, one power hacksaw, one double emery wheel grinder, and one double-end roll lathe. Fig. 8 shows a general view of the mill as seen from the office which is situated on Sherman Avenue N.

Mr. W. N. Currie, is managing director of the company, and Mr. W. W. Leck is superintendent of the mill.

Some Everyday Uses of the Oxy-Acetylene Blow Pipe

By L. G. Dennison, B.A., B.Sc. *

The process of oxy-acetylene welding and cutting although largely practised in a variety of circumstances, which call for ingenuity of application to secure satisfactory results, is nevertheless not as familiarly known, we believe, as it might be; hence the unfolding of carefully selected data, secured from a firm of repute in this business, by the writer, for the benefit of readers of Canadian Machinery.

THE process of oxy-acetylene welding is extensively adopted for the repair of broken parts, a purpose which was perhaps largely responsible for the original invention. Its scope is, however, not limited to this feature, as evidenced by the fact that most industrial plants engaged in the manufacture of machinery have found an oxy-acetylene installation indispensable as a unit in their general equipment..

Here, it may be pointed out, that our two principal railroads, the C.P.R. and the G.T.R., are among those who find such an apparatus of the greatest possible service and value.

The Oxy-acetylene Flame.

The oxy-acetylene flame has a temperature of 6,300 degrees Fah., the highest attainable by combustion. This high temperature is easily explained since acetylene is endothermic,—absorbing heat when being formed. When it burns with oxygen, the heat developed by the decomposition of acetylene into carbon and hydrogen, is added to the heat of combustion of these elements; besides, the concentration of carbon in acetylene is greater than in any other gas,—an increased quantity being as a matter of fact impossible.

Ease of regulation is another feature of the oxy-acetylene flame. Further it gives, by nature, a reducing atmosphere, which prevents the metal from oxydizing. This latter undesirable action takes place in the use of other gases, especially when welding steel.

Oxy-acetylene Cutting.

The blow pipe is a most effective apparatus and finds useful and effective application in cutting risers from steel castings, cutting dies, cutting-out shafting from heavy ingots instead of forging, and cutting beams and ironwork in wrecked or burned structures. It is also used to advantage in cutting manholes in boiler shells as well as for boiler work generally.

The blowpipe is seen in the welder's hand in Fig. 1. As adapted for cutting, it has four holes in the nozzle, one centrally located and three placed concentrically at a radius of about ⅜ of an inch. Oxygen issues from the central orifice and a mixture of oxygen with gasolene or acetylene gas from the others. The oxy-acetylene flame renders the metal red hot, while the oxygen, whose pressure can be regulated, burns the iron to iron oxide. This latter flows away, leaving a clean cut. The flame is moved slowly along the line to be cut, while the torch can be put in a special machine which will move it in any path and keep it perfectly steady. This latter is used particularly for cutting-out circular discs. Some idea of the speed of the work will be gathered from the fact that an armor plate 12 inches thick and one foot long can be cut through in six minutes. Work on armor plates for warships which used to take thirty days can, by the cutting process, be completed in one day. Fig. 2 shows sample plates cut by this method.

The total cost of cutting is from about ½ to 1 cent per square inch of section cut, and the usual rates of cutting will be gathered from the first table on the following page.

In Fig. 3 there is shown a picture of the wreckage of the steel beams in St. Jean Baptiste church, Montreal, recently destroyed by fire. The firm of R. J. Levy have taken the contract to cut down this tangled mass of steel

Fig. 1.—Welder at Work.

*Associate Editor, Montreal.

within a month by means of the oxy-gasoline blowpipe. It is estimated that the work would take six months without the blowpipe. All the large beams cut-up into several pieces bring a better price as scrap.

Thickness of part to cut	Pressure of oxygen	Diameter of opening of oxygen outlet for cutting	Minutes to cut one ft. long.
Up to ½ inch	2 Atmospheres	3-64	1
" " 1 "	2 "	"	1 2-3
" " 2 "	2½ "	"	2
" " 3 "	3 "	"	2½
" " 4 "	3½ "	1-16	3
" " 5 "	4 "	"	3½

Oxy-acetylene Welding.

For welding the blow-pipe has two uses,—first the repair of broken parts, and second, the manufacture of various apparatus, by welding together sheets, profile irons, bars, tubing, etc.

Figs. 4 and 4A, "before and after welding," will give an idea how a costly broken casting can be mended for a few dollars, with resultant strength from 85 per cent. to 90 per cent. of the original. Welding is also used to repair broken crank-shafts and pulley spokes, to fill cracks in engine cylinders, to build up rivets and corrosion pittings in boilers, to renew gear teeth by adding metal, and to make good the deficiencies due to blow holes.

In the manufacture of new composite pieces, its uses are unlimited. Fig. 5 shows how profile irons are welded together for work bench and stand purposes. Fig. 6 shows a high pressure steam collector welded from I beams. Fig. 7 shows a cooler with pipes and flanges joined by welding. Fig. 8 shows a seat and desk welded from sheet steel and tubing.

Besides these, ladders, drums, jackets and tanks are each and all possible of construction by welding.

It is apparent that in addition to mechanical and speed considerations, welding has a great advantage in the matter of cost. The speed of the work causes a low labor charge. The cost of the gases is also comparatively low, all of which, together with a moderate equipment cost, goes to show that the installation of welding equipment will be a machine shop habit in the near future.

App. thickness of plate in inches	Foot run per hour	Oxygen Consumption: cu. ft. per hour	Acetylene, Cons. cu. ft. per hour	*Approximate cost per foot run
1-16	40	4	3	$0.011
3-32	24	5½	4	0.020
1-8	18	9½	7	0.032
3-16	10	14	12	0.077
1-4	7	22½	17	0.106
3-8	4	32	25	0.340
1-2	3	40	30	0.530
5-8	2	52	40	1.005

*Taking oxygen at 2½c per cu. ft., acetylene at 1c per cu. ft. and labor 30c per hour.

TRADES AND LABOR COUNCIL.

TWO important subjects occupied the attention of the Trades and Labor Council, Fort William, at its last regular session, these being the establishment of a labor bureau, and the starting of evening classes.

E. E. Wood, supervising principal of public schools, attended, and spoke on the matter of the establishment of classes in the evening for the workers of the city. He said his first idea had been to get a nucleus, say fifteen, of men who were taking a course in correspondence schools, and help them out with the tasks, for a man made far greater progress when little matters of which he had not had a good conception were promptly explained to him.

The chairman, W. McNicol, said that he had canvassed one shop in the city to see who would become interested in technical studies, and did not find anyone taking a correspondence course, but eight men signified their willingness to join a class.

Mr. Wood said, that the subject came to his mind of the number of young men in the mechanical trades of the city who were endeavoring to improve themselves through correspondence schools, and not having the time to deal with them privately, it had struck him that he might be able to form a class and help those students through their courses. He honored the man who was trying to better his position in the world, and he thought it was an admirable work for the Board of Education to take up, and make profitable to the working citizens. He had learned that there were some hundreds of young men in these cities who were taking such a course, and, as the speaker had taught most of the subjects connected with the mechanical trades, he thought he might be able to assist them, for he found that those who took the private lessons and had everything explained to them made wonderful progress.

With regard to forming classes of men who were not taking the course, he had not contemplated that, though he did not wish to debar anyone from the benefit. It had been his intention to follow the text books of the schools, going through geometry, trigonometry, and allied subjects, giving the men a theoretical understanding of their work, they gaining the practical side at their daily avocation. He was convinced that thousands of dollars were sent away by young men here, who wanted a little assistance.

Secretary Stephens said, that the Trades and Labor Congress had set its face against the trade schools, but Mr. Wood pointed out that there was no mechanical department in connection with these classes, the only idea being to assist the worker through theoretical training and make him a more efficient and capable tradesman.

It was agreed that a committee meet the management committee of the Board of Education to discuss the best method to attain the results aimed at, and the question was adjourned.

Fig. 7.—Welded Cooler.

INQUIRY—SAFE DIAMETER OF EMERY WHEELS.

I would deem it a favor if you would let me know whether the manufacturers of emery wheels have any data at their disposal which would show the safe diameter for their wheels to wear to. By this I mean,—is there any set rule that governs the factor of safety in an emery wheel as it decreases in diameter from usage? It has occurred to me, in reading lately of several deaths, resulting from exploded emery wheels, that, there may be a known diameter for different wheels, below which it is not safe to operate them. Any information along these lines will be greatly appreciated.—G. Vandervoort.

NEW TYPE OF LOCOMOTIVE.

The London & Northwestern Railway in conjunction with the Great Central Railway, is experimenting with electric locomotives generating their own power. Designs for three of these engines are being prepared. Electricity will be generated by a dynamo driven by a petrol engine. Experiments have previously been made with an electric locomotive in which the dynamo was driven by a steam turbine, but the type proved unsatisfactory in the matter of economy of working. By replacing the turbine with a petrol engine, a great deal of weight and space will be saved. If the new type of locomotive is successful, railway electrification will, it is believed, become a simple matter.

Recent Developments in Tools and Dies for Drop-Forging

by Calliope

Drop-Forging Occupies a Large Place in the Constructional Detail of Many Machines and Appliances Which Form the Product More or Less of Almost Every Mechanical Manufacturing Concern. The Following Particulars of the Developments in Tools and Dies Should, Therefore, Appeal to a Wide Circle of Readers.

A NUMBER of radical changes have been made in the design of the new drop-forge press brought out by the E. W. Bliss Co., Brooklyn, N.Y., based on the experience gained in their own drop-forge shop. The new features relate to the reduction of wear and breakage. Operating a shop of considerable size and style, size and shape of drop-forgings being numerous and varied, it follows that the hammers receive a severe test on a wide range of work. Some of these tests, a few samples of the forgings produced by them, and a description of the dies in which they are formed, will be here discussed.

Propeller Wheels.

On the left of Fig. 1, are shown two halves of the die that forges the propeller wheel, used for the submarine torpedoes made by the E. W. Bliss Company. These propeller wheels are made of drop-forged steel, great strenbth being required to push the torpedoes through the water at the rate of 23 knots per hour. In making these, round blocks of steel are cut up as shown at A in the upper left-hand corner. Each block is drawn out by the man on the steam hammer, to the shape shown at B. On one of the blades, as at C, an end is drawn out, to serve as a handle during the drop-forging process. After this operation, the piece is taken to the drop-forge press, and hammered into the two half dies shown below. It then assumes the shape shown at D.

Owing to the difficulty of making trimming dies, and the number of propeller wheels wanted, not warranting the expense, the flash is trimmed off by hand, leaving it as shown at E. In the machine shop, it is made absolutely smooth and true to size, by machining with profile cutters.

Odd Shaped and Large Forging.

In the right-hand half of the cut is shown an odd-shaped piece, requiring an irregular parting line on the forging dies. At F is shown the lower die used in forging this piece, and at G the upper half, which is fastened in the hammer of the drop. This piece is forged from a plain bar, and is first broken down between H and I of the two halves of the die. After this it is hammered into shape, and leaves the die as shown at J. It is next taken to the trimming die, the lower half of which is shown at K, and the upper part at L. After going through this, the piece is ready for the machine shop, and in the shape shown at M.

One of the largest pieces drop-forged, is shown in Fig. 2. This is made in several sizes, the largest of which is about 24 inches long. The bar is first

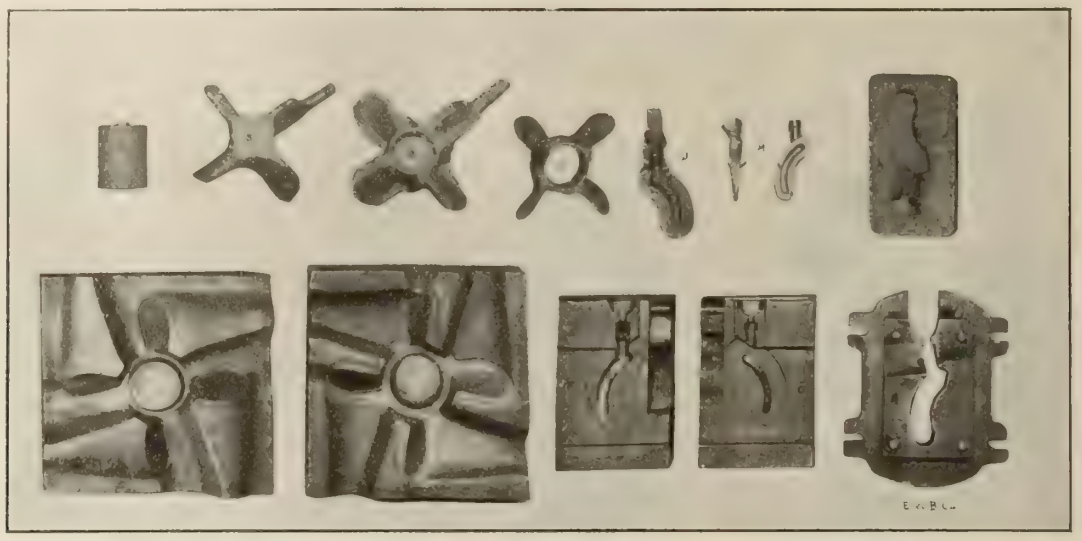

Fig. 1—Drop-forgings and dies for propeller wheel and turbine nozzle.

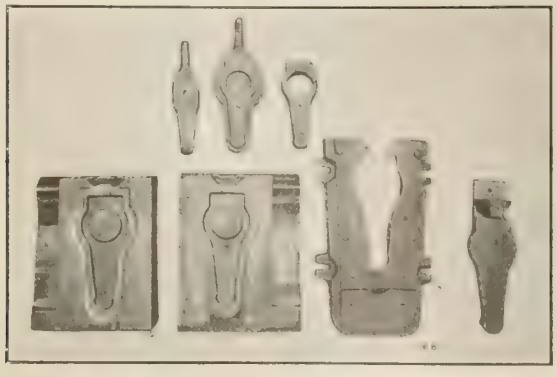

Fig. 2—Forgings and dies for a good-size piece.

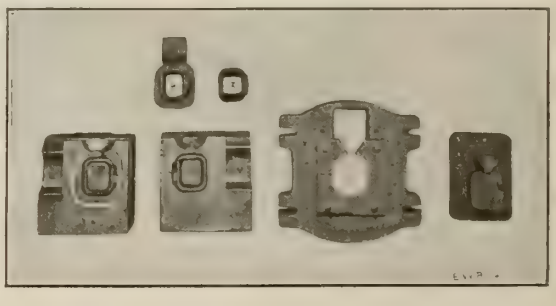

Fig. 3—Dies for drop-forging the piece shown.

broken down between N and O of the forging dies, and changed into the shape shown at P. After this it is drop-forged in the dies shown, and leaves them in the condition seen at Q. The final operation is to trim it in the dies shown at R and S, and these leave it in the shape seen at T, ready for the machine shop.

Bronze Forging.

That bronze can be drop-forged as easily as steel is shown by the piece in Fig. 3, also the dies that are used. This piece, like the steel forgings, is broken down from the solid bar between U and V of the forging dies, and afterwards formed into shape between them, and leaves in the shape shown at W. After this, the flash is trimmed off with the dies X and Y, leaving the forging in the shape seen at Z, ready for machining.

New Drop-Forging Hammer.

The new press made for use on this class of work is shown in Fig. 4. The side frame has been altered in shape; a new mechanism has been devised for adjusting it to position at the bottom; the method of fastening the drop to the board has been changed, and the parts used for taking up wear have also been altered. The operating device is shown in Fig. 6, and the wear on the front roll which in combination with the back is taken up by adjusting screws. The roll grips the board to lift the hammer, method of fastening the board in the drop has been changed so that it is no longer necessary to take a 2½ inch plank and plane the greater part of its length down to 1½ inches in order to get a bevel on one end, only 2 inches long. With the new scheme, a straight plank is used and a tempered steel piece with saw teeth on one side is slipped into the dovetail at the back of the hammer head, along with the lifting board. On the opposite side of the board, a wedge is dropped into place, after which the holding wedge is driven in tight. This causes the saw teeth of the steel wedge in back to grip the board and hold the hammer head.

In Fig. 5 is shown the method of adjusting the side frame. By backing out the set screw and removing two bolts, the entire adjusting apparatus can be removed for replacement or repair. Its method of moving the side frame forward and back can be plainly seen from the illustration.

Strength of Side Frames.

In Fig. 7 is shown the alteration in the sectional design of the side frame, and the greater strength that has been obtained thereby. The strains that are set up in these side frames by the dropping of the hammer, as well as the method of computing their strength, are also shown. When the drop falls in an absolutely perpendicular line, and strikes exactly central, no strains are transmitted to the side frames or uprights of the press. This, however, seldom occurs in actual working conditions, and therefore it is necessary to have side frames of considerable strength. If a 1000-pound hammer, such as shown, drops 30 inches and strikes 4¼ inches away from the centre, and is brought to rest by performing work through a distance of 1-32 of an inch, then a mean force of 158,000 pounds is exerted against the side frame at B, during the time in which the hammer is being brought to rest.

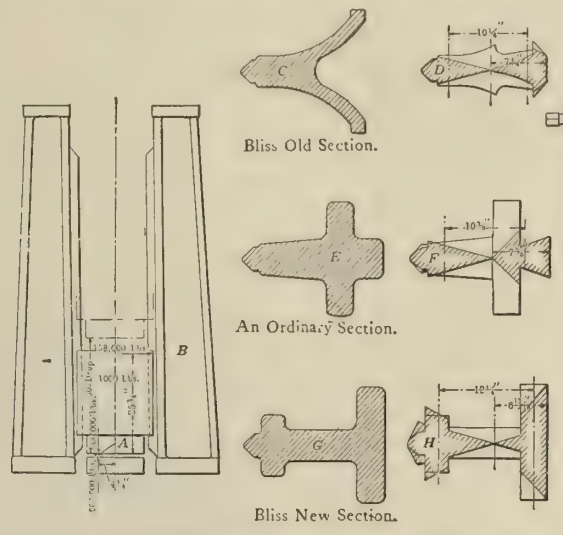

Fig. 7—Types of side frames and their relative strength.

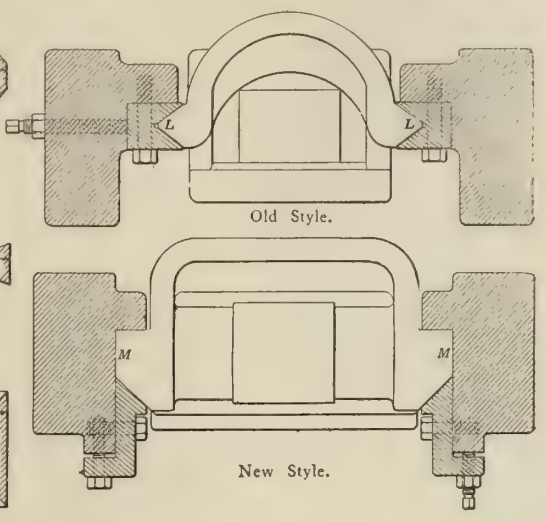

Fig. 8—Old and new style of trimming press frames.

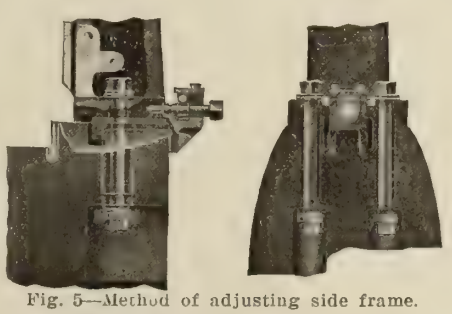

Fig. 5—Method of adjusting side frame.

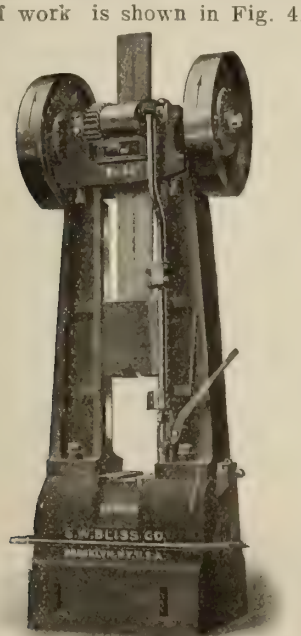

Fig. 4—New drop-forging hammer.

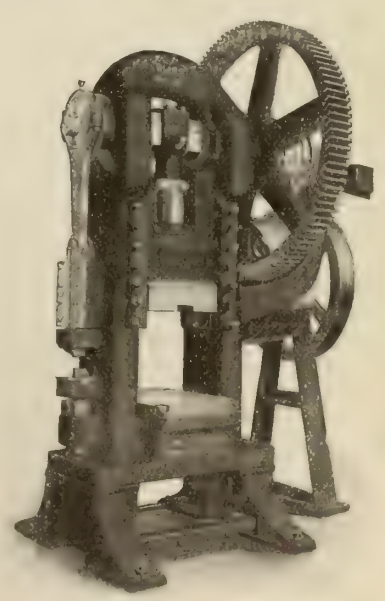

Fig. 9—The new trimming press.

The method of computing the mean force exerted against the side frame is as follows:

Mean force exerted on work in dies

$$\frac{1000 \text{ lb.} \times 30 \text{ in.}}{1\text{-}32 \text{ in.}} = 960{,}000 \text{ pounds.}$$

Mean force sustained by side frame:

$$\frac{960{,}000 \text{ lb.} \times 4\frac{1}{4} \text{ in.}}{25\frac{3}{4} \text{ in.}} = 158{,}000 \text{ pounds.}$$

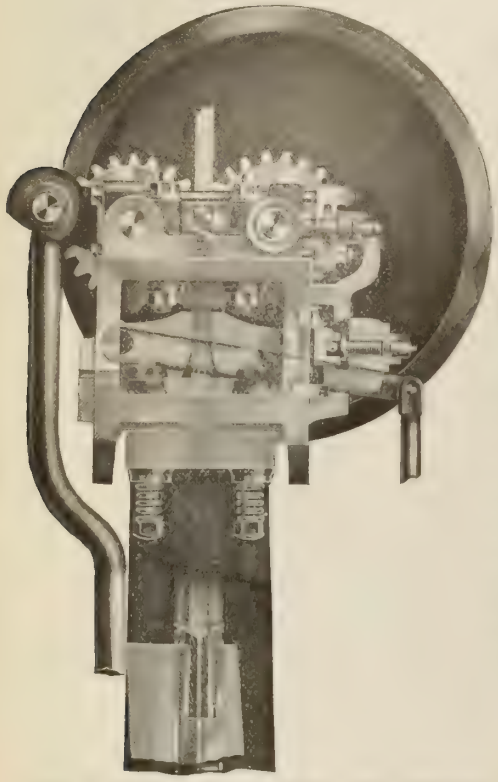

Fig. 6—Mechanism for lifting the hammer.

In the old style of drop-forge hammer built by the Bliss Co., the side frame was given a sectional shape like that shown at C in Fig. 7. In this type, the virtual stress area to resist pressure delivered at B. is shown by the sectional lines in D. Its ultimate B.M.R.=18.34 $\times$18,000$\times$10¼=3,380,000. And in it Z =18.34$\times$10¼ = 188, and I=188$\times$7¼ =1362.

An ordinary section for drop-forge hammers is shown by E. The section of this, to resist the impact, is shown at F. In it Z=27.52$\times$10⅜=236, and I= 286$\times$7⅜=2110. The ultimate B.M.R.= 27.52$\times$18,000$\times$10⅜=5,130,000. A sectional view of the side frame used in the new drop hammer is shown at G. The stress area to resist the impact of the hammer blow is shown by H. For this frame Z=43.07$\times$12¼=528, and I =528$\times$6 13-16=3595. The ultimate B. M.R.=43.07$\times$18,000$\times$12¼=9,500,000.

Comparisons of Strength.

In comparing these, it will be seen that the old style is exceeded in transverse resistance by the later type. In rigidity the old section is also exceeded by the later or ordinary section E. With regard to the value of rigidity, it is worth mentioning that a hammer frame absorbs energy when under side pressure, equal to the pressure times the distance deflected, and that the energy so absorbed, is an appreciable loss. The most rigid frame is, therefore, the most efficient for avoiding this kind of loss and for obtaining the maximum of useful work from the hammer blows.

Trimming Press.

The new trimming press is shown in Fig. 9. This has been altered in numerous places, where better design would give better results. The most notable change is in the form of the guides, and the method of connecting the slide to the crank shaft. The old and new styles of guides are shown in Fig. 8. The V-shaped blocks, as shown at L, used in the old style of press, with their clamping and adjusting screws, are shown in the upper view. The style adopted for the new style is shown in the lower view at M. This consists of a right-angle bearing on one side of the slide, and a bevel bearing on the other, to hold the slide in place and take up the wear. This bevel bearing is held in place by clamping and set screws as shown.

This design gives nearly double the wearing surface of the V-blocks, and is easy to machine. The line cut plainly shows the way the holding piece is put in.

LARGE ROPE SHEAVE AND SHAFT BEARING.

THERE is illustrated in Fig. 1 a rope sheave 8 ft. diameter by 16 ft. 10 in. width of face, 14 in bore, and weighing 66,750 lbs. It was made in four sections with heavy return flanges, and when erected these were bolted together, making a solid, substantial job. It carries 72 wraps of rope, and was designed for 4,000 h.p. at 187 revolutions per minute.

Fig. 1.—Large Rope Pulley made by The Dodge Mfg. Co., Mishawaka.

In order to carry the weight, a hollow shaft was designed with 20 in. bearings, bossed to 24 in. at the sheave hub, and having a 14 in. hole through its entire length of 28 ft. 6 in. That the weight of the coupling might be reduced, flanges were forged at each end of the shaft 30 in. diameter by 2½ in. thick to correspond with the flange couplings of the driven shaft at each end. The finished shaft weighed 24,375 lbs. To carry this enormous weight at the operating speed, a new design of bearing was used. Each mammoth bearing, Fig. 2, weighing complete with the base plate 10,600 lbs., is lined with babbit metal, and has a bearing surface of 20 inches diameter by 56 inches long. They are self-oiling, using two brass rings 1½ in. by ¾ in. to insure perfect lubrication.

The whole outfit, now in operation,

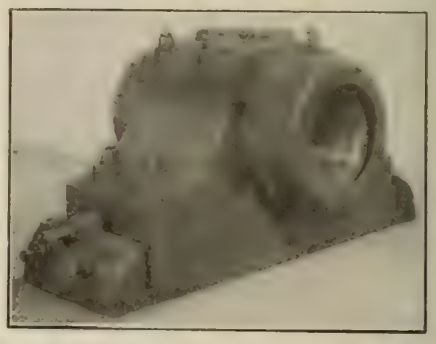

Fig. 2.—Mammoth Bearing made by The Dodge Mfg. Co., Mishawaka.

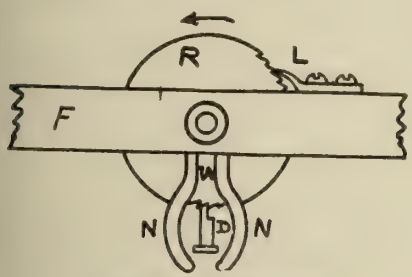
was furnished to the Pittsburg Plate Glass Co., Ford City, Penn., by the Dodge Mfg. Co., Mishawaka, Ind.

TUNGSTEN DEVELOPMENTS.

A discovery which, it is said, may revolutionize electric lighting was made public recently. It was announced by H. R. Spoorberg, of the British Thomson-Houston Co., that after three years' research work, the company had succeeded in producing tungsten in such a form that it could be drawn into a continuous wire one-thousandth of an inch in thickness, and used in any length or bent to any shape. At the same time its tensile strength had been increased. Hitherto, tungsten has been producible only in short lengths. The new discovery makes it possible to use a continuous wire in a lamp, so that the risk of breakage is reduced to a minimum, and the life of the lamp is considerably extended.

Gas-engine lubrication by "splash" from the crank case is in the same class with hot tube ignition, the old tallow cup on steam engines and the high-wheel bicycle.



MACHINE SHOP METHODS AND DEVICES

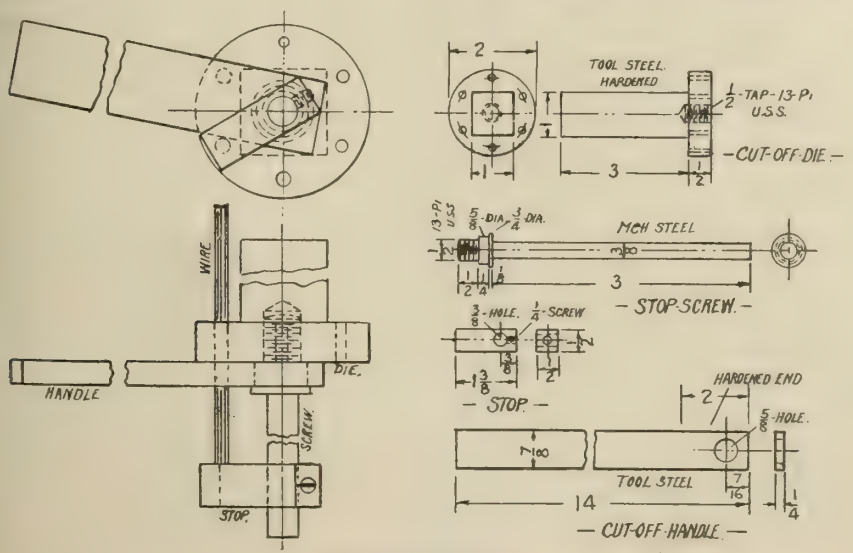
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

THE POWER HACKSAW.

By Donald A. Hampson, Middletown, N.Y.

THOUGH generally regarded as an adjunct, the power hacksaw is or can be made of vital importance in machine shop work. Much of the indifference show can be traced to the lack of a little study or to the idea that the hack-saw is semi-automatic,—regulating itself without attention—to all kinds of work. Fancy such a conception of the lathe or grinder!

The Power Hack Saw.



For sawing brass and the softer metals, a much faster feed should be used than for iron or steel; the same applies to pipe and tubing cut in the machine. It is the part of economy, also, to provide blades with finer teeth (not less than 24 to the inch) so that in passing across the thin sections of metal the teeth will not be stripped. In sawing rough castings it is often advisable to mark the cut on the upper side with the edge of a file, thus not only saving the saw the task of scraping off the sand and scale, but forming a definite line for it to start upon. This will go a long ways towards preventing crooked cuts.

Steel and wrought iron give more trouble than other metals, largely in the matter of broken blades, stuck blades, and crooked cuts. Oil is the great panacea for these troubles; not a flood, but a drop or two at the start with repetition if the section is wide or deep, In one case, three or more new blades were put in during every day of steady dry sawing, and when oil was adopted as a lubricant one blade lasted all day and was in good shape at night, with a nice pile of clean straight cuts to its credit. Too often the mistake is made of forcing a cut too much on a bar of steel. In the long run, a moderate feed will sever more pieces from a bar, will require less attention and use fewer blades than will fast feed. The light feed is particularly to be desired at starting.

The Economical Use of Blades.

Have a spacing block for use in the vise of the machine. In cutting narrow pieces the "position" of the stroke is seldom such that the front half of the saw receives the wear, and as a great deal of the work comes in this class, a considerable number of "wornout" blades still boast a half set of full teeth. With a spacing block laid in the back of the vise, the work is thrown to the front when the full length of the blade can be utilized.

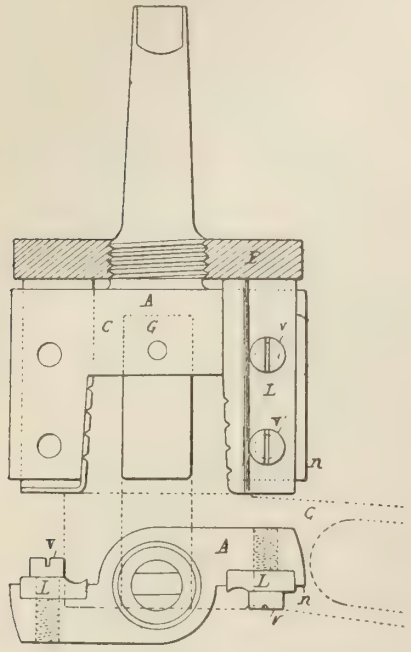
It is not the intention of the writer to speak of the loss in efficiency due to run-down physical condition, yet most power saws are given to a defect, after long usage, that is easily remedied and might indeed be applied to new machines with good effect. When the teeth of the ratchet wheel become rounded and the split nut wears or the pawl spring loses its "life," the feed is apt to become spasmodic, and at each stroke the pawl carries the wheel backwards a tooth or two. Often this occurs at but one point in the screw's revolution, the saw running several minutes without feeding. In the drawing F is the saw frame, R the ratchet wheel, N the handles of the nut, and D the pawl. L is a latch screwed to the frame—its end, light and spring tempered, lightly engages the teeth and prevents back motion without excessive wear. With the pawl spring stiffened, the full feed is realized.

Hand Wire Cutter.

HAND WIRE CUTTER.

By J. E. Cooley, Hartford, Conn.

A simple and inexpensive hand wire-cutter which can be made from materials already in the shop is shown in the enclosed sketch. The only adjustment required in its use is the stop for cutting different lengths of wire. It will cut any size of wire from No. 0 to $\frac{1}{8}$ inch diameter, and in lengths from $\frac{3}{4}$ up to $2\frac{1}{2}$ inches, at the rate of 150 a minute. The end of the die-cutter is milled 1 inch square, so that it can be gripped in a vise when in use. The wire is hand fed to the stop, through any of the holes in the die-cutter, and is cut off by pulling the handle down. The handle is hardened for about 2 inches on the cutting end, so that the edge will not wear. The drawing shown here is so plain that no further explanation is necessary.



CONICAL TURNING ON THE DRILL PRESS.

From La Machine Moderne.

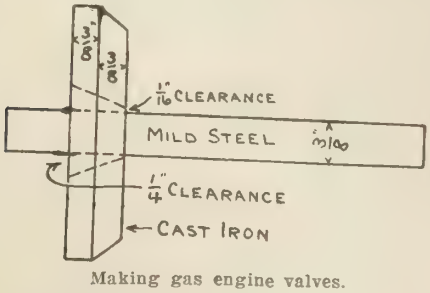
HAVING to machine some automobile wheel seats as shown at C, and the turning of the conical part being impossible except on a large gap lathe, I had to do the job on a drill press. My first idea was to mill it, but the size of the work would not allow of a complete revolution of the table, and by milling part of it at one time and then re-setting the work, much delay would have been occasioned and a poor finish obtained.

I made up the tool-holder, A, with a taper shank to fit the drill press, and carrying on the arms two cutters, L, of high-speed steel. The cutters are held in their correct position transversely by the check seen at N. The thrust collar, E, allows of their vertical adjustment

and at the same time prevents them from rising. The cutters are further secured by the screws V.V. The pilot G is hardened and ground, and held in place by a pin in case it should have any tendency to stick. The notches in the two cutters are not opposite each

Conical turning on a drill press.

other; their purpose, of course, being to break up the chips.



This tool turns out the work perfectly true and with a finish equal to that obtained on a lathe.

MAKING GAS ENGINE VALVES.

By L. C. D., Montreal.

GAS engine valves are often wanted with cast iron seat and mild steel stem, in which case a casting is made for the seat as shown. The stem, a mild steel bar of required size, is taken and welded to the seat as follows.

The seat, with the large end of the conical hole upwards, is placed on an iron plate having a hole in it, through which the stem is put and adjusted by hand until the upper end is about ¼ of

Making gas engine valves.

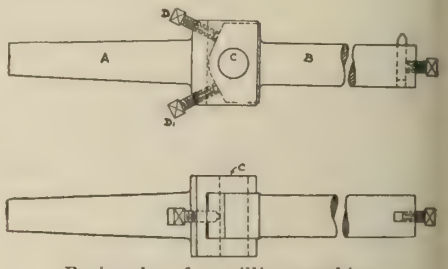
an inch above the seat surface. Application of the blow pipe fuses the end of the stem which flows down and fills the conical hole, giving a strong weld capable of withstanding considerable shock.

A DRILLING JIG.

By A. P.

HAVING a number of small engine connecting rods to make, whose cylinder piston clearance was not to exceed 1-32 inch, it became necessary to have them conform exactly to the drawing centre, and at the same time be interchangeable.

To obtain this, I arranged for the drilling and reaming of the gudgeon pin hole to be the last process, then, having the crank pin end finished, and the piston end machined to width, I made the jig as here described, taking advantage at the same time of the centres put in for turning the crank pin end.

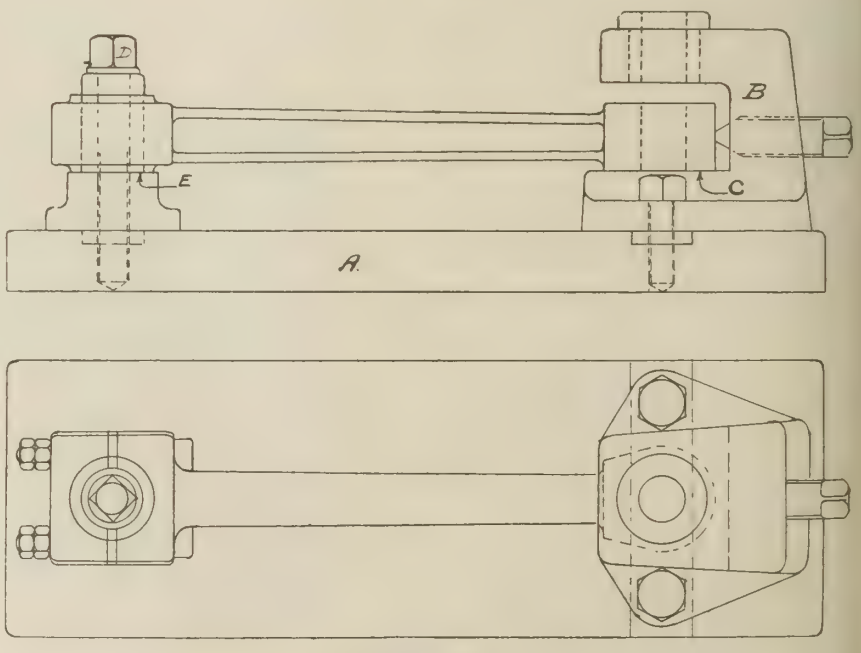


The jig consists of a flat wrought iron base plate A, at the right hand end of which a rectangular groove is cut across to locate a cast iron bracket B, by means of a strip machined to fit, and held in position by two set screws. This bracket is fitted with an adjustable screw, whose case-hardened conical end engages the centre in the rod. The face C is slotted or milled to the correct height from the centre of this screw, being equal to half the thickness of the rod. On the top of the bracket, a hole is bored concentric with the rib on the under side to receive a hardened tool steel button, which acts as a pilot for the drill, etc. At the left hand of base plate is a turned peg, held in place by set screw D, and located by the spigot on the under side, which fits a recess bored in the plate. The peg is turned to fit the large end of the rod, and has a shoulder E formed upon it to keep the centre line of the rod parallel, and, therefore, square to the drill and reamer.

The jig is now clamped down on the drill press table, and when the rods come to be drilled, the large end is slipped over the peg, then swung round into position and held there by the square ended adjustable screw, all ready for the usual process of drilling and reaming.

BORING BAR FOR MILLING MACHINE.

By H. E. Fozard, Ottawa.



THE accompanying illustration shows a simple, inexpensive and useful boring bar for the milling machine. In the small machine shop handling general work with a limited plant, it is of exceptional service on jobs too large to swing in the lathe, or for those of irregular shape. I have used it with

Boring bar for milling machine.

much success in boring gasoline engine cylinders.

A, the shank to fit milling machine spindle, has a slotted end. Pin C is a tight fit, and upon it the tool bar B swings. Depth of cuts taken are regulated by set screws; thus, by slackening D and tightening D_1, the radial course taken by the cutting tool is enlarged.

A drilling jig.

PREVENTING OF TAPS FROM BREAKING.

THE sketch, reproduced herewith, shows a handy kink to prevent taps from breaking. It is discouraging when tapping out a small hole in a piece of work to have the tap break off in the hole. In most cases, this means annealing the broken part before it can be drilled out. To avoid this difficulty, cut a line parallel with the shank of the tap, as shown in the drawing, and heat it half way between the threads and shank end, to a light blue color.

A tap which gives warning of undue strain.

This will obviate the breaking of the tap, as the shank will twist before it will break, and the line will show that it is twisting, thus giving the user warning. Needless to say, this has proved to be a very valuable little kink on small taps.—Scientific American.

INSERTED BLADE TOOLS.

By Chas. Hattenberger, Buffalo.

OWING to its cost, not a few manufacturers hesitate to use high speed steel on some of their tools, such as reamers, taps, counterbores, etc. One suggested solution to their problem is the use of tools with inserted blades held in a suitable holder.

Fig. 1 shows a taper reamer with blades held by means of wedges. A is the body which has slots milled in it for the blades C ; an equal number of slots are also milled to accommodate the wedge D, the taper of which is ½ in. in 12 inches. B is a case-hardened thrust collar with holes drilled for spanner wrench. To assemble this tool, screw thrust collar down firmly against shoulder and insert blades against the collar. The wedges are then driven tight by means of the drift shown. This tool, if properly made, will stand a tremendous amount of hard usage, and after being dulled, can easily be reground to the correct size by placing shims made of tin or brass under the blades. If the ends of the blades are sharpened, it may be used on cored holes, cutting a very smooth hole.

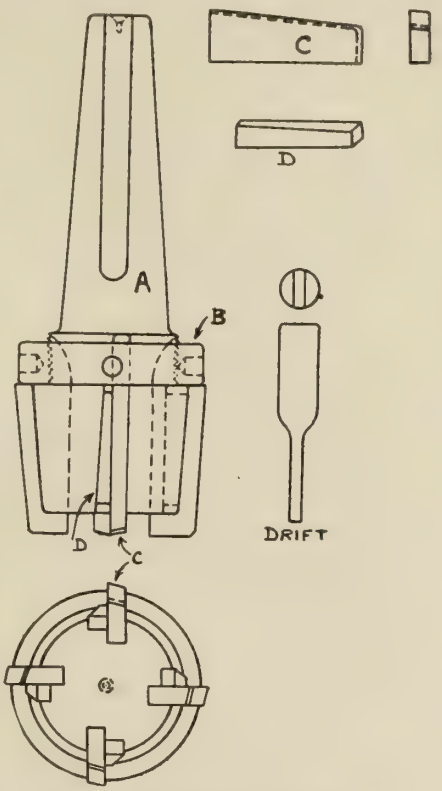


Fig. 1—Inserted Blade Tools.

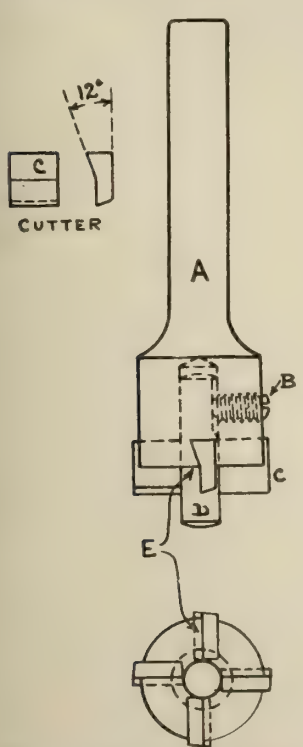

Fig. 2—Inserted Blade Tools.

Fig. 2 is a facing tool which consists of body A, having a hole drilled in its centre for pilot D, and four slots for cutters C. These slots are cut in the shaper. The cutters have one side inclined at an angle of 12 degrees and should fit snugly into the slots. They are held firm by caulking at point E. A set screw for holding the pilot is shown at B. A drill may be substituted for the pilot. If used with ordinary care, it should last a long time ; it is, however, not adapted for heavy cuts. In sharpening take out the pilot.

A straight reamer having long blades is shown in Fig. 3. The body A is shown with five slots milled in it for the blades; it is also threaded to receive the thrust nut B and collar C, which serve to jam the blades down upon the thrust cap D. Five slots are milled in the face of D at an angle of 60 degrees. E is a countersunk head screw with a square milled for a wrench. It also has a countersunk hole on top to be used as a centre in grinding. After the blades become worn it is only necessary to place shims under them and grind back to size. F shows one of the blades.

Fig. 4 shows a two-lipped tool which was used to rough out a drilled hole prior to finishing with a hand reamer. A is the body which has a slot through its centre to receive the cutter B. The slot was formed by drilling a series of holes, chipping out the core and filing. The cutter has a slot through its centre and has a taper hole to admit the adjusting screw C. A taper pin D holds the cutter in place. The portion E may be left on, if so desired, to act as a pilot.

A tap with inserted blades is shown in figure 5. Four slots are milled in the body A, to receive the cutters B. The cutters are held by means of two pointed setscrews, D. The screw points engage the countersunk holes in the blade at a point a little above and a little to the left of the centre, as shown at E. When tightening the screws, the blade is forced against the bottom of the slot and also against the thrust collar C. Care must be observed so as to mill the slots radially. F is a recess 1-16 inch larger than the size screw used. Thrust collar C, as well as the setscrews, must be case-hardened.

A combination drill, countersink and recessing tool is shown in Fig. 6. This tool was used in the centering machine to countersink and recess the ends of

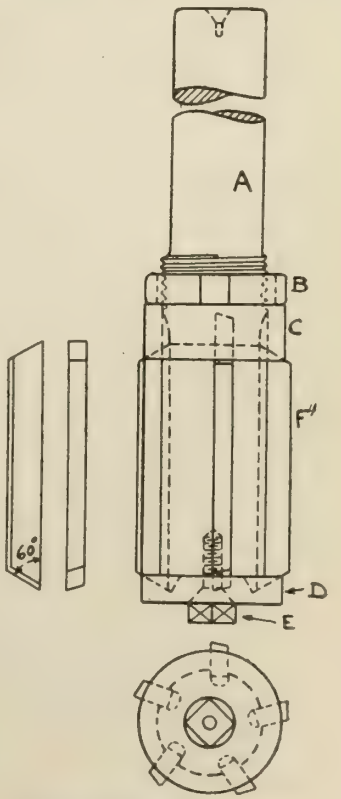

Fig. 3—Inserted Blade Tools.

shafts as shown at A. It consists of the body B with a slot milled in it for the blade C, and threaded about half way down, for the split collar D which takes the thrust, the blade being secured by the split collar E. The rest of the sketch explains itself.

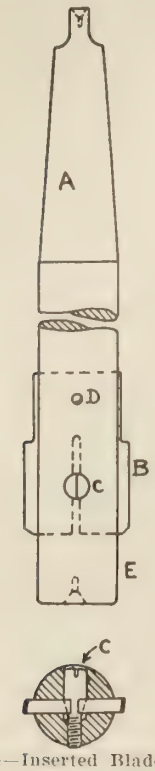

Fig. 4—Inserted Blade Tools.

At Fig. 7 is shown a reamer used for holes of large diameter. The body A is acts as a thrust collar. The blade C is first turned complete in the lathe, then slots are milled for the cutters B, which

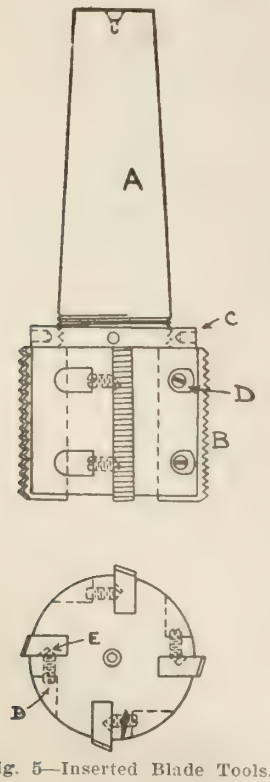

Fig. 5—Inserted Blade Tools.

are held in place by fillister head machine screws. The body containing the blades is again put in the lathe and turned off to within .010 inches of the required size. After this operation the angular flutes C are milled and then using another angular cutter, the flutes D are milled. Care must be taken to mill the cutting faces radially. The blades are next taken out and hardened, after which they are again inserted in the holder and ground to the correct size.

SPACING CIRCLES.

By H. E. Fozard, Ottawa.

IN the course of my experience in the machinist business, I have found very few workmen capable of setting their dividers for spacing circles, without having to try round the circle several times, and thereby wasting valuable time. The following formula is an accurate and simple method, which will enable the machinist to set his dividers correctly first time. Sine of

$$\text{Sine of } \frac{360 \text{ degs.}}{\text{number of spaces} \times 2} \times$$

inches diameter of circle to be spaced. For example, a circle 10 inches in diameter to be equally spaced for 9 holes.

$$\text{Sine } \frac{360 \text{ degs.}}{9 \times 2} = \text{Sine 20 degs.}$$

By looking up a table of trigonometrical ratios to be found in almost all machinists' books, we find Sine 20 degs. =.342, which, multiplied by the number of inches diameter of circle, namely 10 inches, gives 3.42 inches as the dimension to which to set the dividers.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

VANADIUM STEEL CASTINGS.

Steel castings containing vanadium should never be used without annealing. In the unannealed state they are more brittle than plain carbon-steel castings. In annealing vanadium steel castings, it should be observed that a somewhat higher temperature is required than is used when annealing ordinary steel castings. A temperature of at least 1,500 degrees F. is necessary, and it is preferable that a temperature of 1,560 degrees F. be used. Rolling mill pinions made from vanadium steel castings have proved to have from two to three times the life of carbon-steel pinions and from one and a half to two and a half times the life of nickel-steel pinions.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

PAPER FILE HANDLE.

THE cut shows the indestructible paper file handle placed on the market by Schuchardt & Schutte, Coristine Building, Montreal. Its features are that it does not split, wears well, and being perfectly smooth, ensures against sore hands or splinters.

The indestructible paper file handle.—Schuchardt & Schutte, Montreal.

SEARCHLIGHT UNIVERSAL LAMP BRACKET.

THE question of good light, in the machine shop, draughting room, and in fact every department of the factory, is one which is receiving an increasingly prominent degree of attention, and everything tending towards that attainment which brings more comfort to the operator, lessens the danger of accident, ensures higher quality and greater output is more or less educative, valuable and welcome.

The "Searchlight Universal Lamp Bracket," which we illustrate, is designed and manufactured by the Mc-

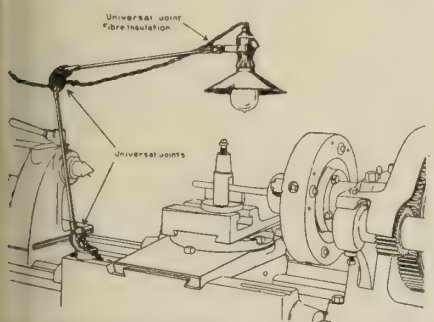

Fig. 2—Searchlight Universal lamp bracket—lathe attachment.

Crosky Reamer Co., Meadville, Pa., with a view to satisfying the foregoing conditions.

Figs. 1 and 2 show the apparatus with style A bracket attached to a wall and to a table respectively. Other applications with style B, C and D brackets are specially adapted for floor, bench, ceiling, drafting, lathe and desk attachment. The searchlight combines such features as being absolutely universal, instantly manipulated, easily installed, adaptable to all places and conditions, insulated, rigid, neatly finished, light and compact.

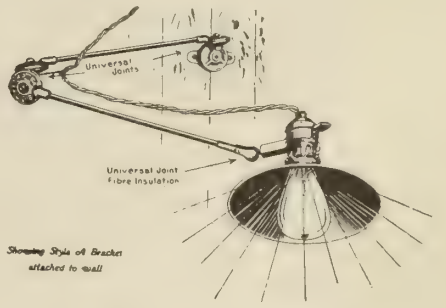
The universal joint consists of friction discs so arranged as to give both horizontal and vertical movements.

Between each pair of discs is a friction washer, and the amount of friction is regulated by screws and lock nuts, which hold the friction uniform at any desired tension. The arms are of solid steel, and the discs are malleable iron machined to a perfect bearing on the friction washers between. All the brackets are 30 inches long, with the exception of style D, and give a range of 5 feet. They are plated by an electro-galvanizing process, which gives an aluminum finish, rust proof and pleasing to the eye.

THE SIBLEY ALL-GEARED DRILLING MACHINE.

EXCLUSIVE features of this new box column all-geared drilling machine, built by the Sibley Machine Tool Co., South Bend, Indiana, are the direct drive, the speed box being located on top of the column, and the elimination of every part not absolutely necessary and not affecting its range and convenience. Further, all gears are enclosed and run in oil, while all bearings have self-oiling devices. In operation, this machine has been designed with a view to convenience. It can be started or stopped, feeds and speeds changed, and table adjusted by the operator without moving from his position in front of the press.

The speed box is located in the logical place on top of the column, which necessitates the use of only one pair of bevel gears to deliver the power to the cutting tool. Any one of the eight speeds can be selected instantly without running through intermediate changes. The semi-steel feed gears are always in mesh, and changes are effected by means of a patented internal key which will not stick or bind. Six long split bushings of special bronze, with 97 square inches of bearing surface, carry the main gear shafts. These latter are of high carbon steel. The entire mechanism runs in an oil bath, insuring constant and thorough lubrication. Hoods at the ends of the bearings catch the surplus oil, which returns to the case through large drains.



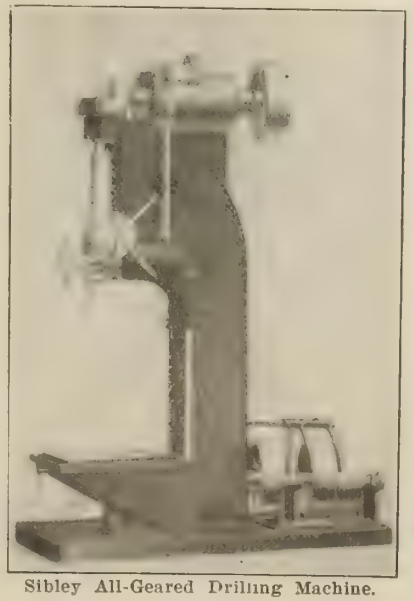


Fig. 1—Searchlight Universal lamp bracket—wall attachment.

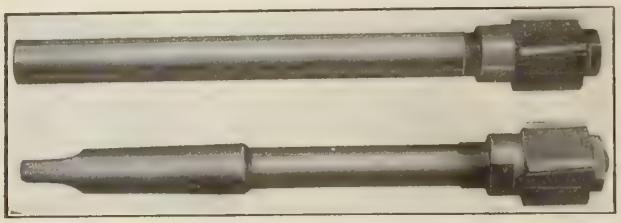
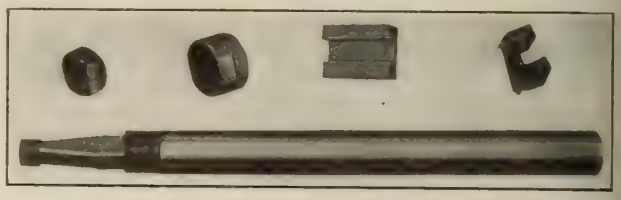
Sibley All-Geared Drilling Machine.



The spindle, of high carbon steel, is finished by grinding, as is also the graduated spindle sleeve. The spindle runs in two bronze bearings, which are equipped with self-oiling devices. A ball thrust collar is supplied, and guaranteed not to crush under the most severe service. The feed mechanism derives its power from the main drive shaft, which directly rotates the spindle and is geared down in such generous ratios that an unusually powerful feed is obtained. There is only one pair of steel bevel gears in the entire feed; these, together with all feed gears and the steel worm, run in an oil bath.

Four changes and a neutral position are obtained by moving a small knob in the centre of the hand wheel. A positive adjustable collar on the graduated spindle sleeve trips a latch at the desired depth of hole, and the entire mechanism swings down from the worm gear on a large hinge pin. A special wear-resisting bronze alloy is used in the worm gear.



Absolutely every gear on this machine is enclosed and running in an oil bath. The countershaft bearings, as well as spindle bearings, are equipped with self-oiling devices, and a self-oiling loose pulley is supplied which will run several months without attention. Another exclusive feature is the pump and tank for supplying lubricant to the cutting tool. Tank, pump and all pipes are enclosed within the column, and the cutting compound returns to this tank through a drain in the table which is not visible outside. By this means the machine can be kept neat and the compound free from chips and dirt.

The design, it will be noted, is unusually heavy and compact throughout. There are no exposed moving parts beyond the pulleys and spindle, and everything has been designed to carry many times the load guaranteed, namely, to drive the best high speed drills from $\frac{3}{4}$ up to $1\frac{3}{4}$ inches at their most efficient speeds and feeds. The specifications are given herewith :

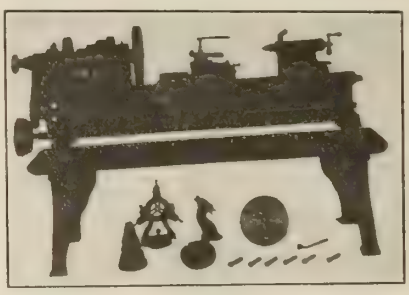
Swing, 24 in.
Maximum distance, spindle to table, 27 in.
Feed of spindle, 12 in.
Feeds per revolution of spindle, .008 in., .015 in., .024 in., .032 in.
Smallest diameter of spindle, $1\frac{3}{4}$ in.
Diameter sleeve, $3\frac{3}{8}$ in.
Morse taper hole in spindle, No. 5.
Working surface of table, 16 in. x 20 in.
Vertical traverse of table, 20 in.
Diameter of all pulleys, 13 in.
Face of all pulleys, $4\frac{1}{2}$ in.
Spindle speeds, 75 to 450 R.P.M.
Countershaft speed, 400 R.P.M.
Height over all, 6 ft. 10 in.
Weight, 2200 lbs.
Floor space required, 29 in. x 57 in.

The "Ideal" adjustable high-speed reamer.

The "Ideal" Reamer Parts.

A NEW STYLE LATHE DOG.

THE West Steel Casting Co., Cleveland, Ohio, have brought out an improved type of lathe dog designed to afford all possible protection to the workman. As may be seen from the cut, the top of the dog is in one piece, covering the set screw making it impossible for the lathe hand to catch his sleeve in the revolving work, as so often happens with the old style dog with no screw protection. An ordinary standard wrench is used on the set screw for adjustment, and should the latter become damaged or burred, it can be removed by placing a socket wrench through the top hole.



New style lathe dog.

The dog which may be had with either a bent or straight tail, is made of crucible cast steel having a tensile strength of 70,000 pounds per square inch. The set screw is of high grade steel and has its end hardened.

NEW 14-INCH LATHE.

THE illustration shows a new 14 inch lathe now being built by the Miami Valley Machine Tool Co., Dayton, Ohio. It has strength, accuracy, and simplicity, and is designed to meet the demand for machines to be used in manual training schools, auto garages, as well as general manufacturing plants. The actual swing, over the bed, is $14\frac{1}{4}$ inches and the hole through spindle which runs in large phosphor bronze bearings is 1 1-16 inches. The carriage has three bearings on the bed, the third bearing giving additional strength to the heavily ribbed cross bridge. All bearings are hand scraped. The machine can be equipped with draw-in spindle, collets, and taper attachment, thereby making a high grade tool room lathe. It can also be furnished with regular style legs without oil pan.

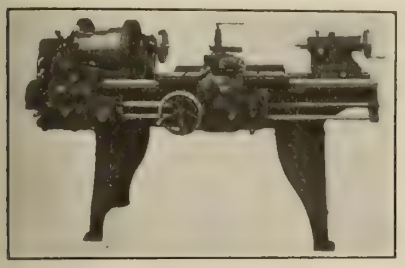
14-in. Lathe—The Miami Valley Machine Tool Co.

The usual equipment is furnished with each machine.

ADJUSTABLE HIGH SPEED MACHINE REAMER.

THE Ideal adjustable high speed machine reamer made by the McCrosky Reamer Co., Meadville, Pa., is designed to ream with ease the toughest, hardest and most fibrous metals, without binding, heating or clogging up with chips, and to leave every hole true and smooth and round. This reamer differs radically in construction from other adjustable types, there being only two solid blocks of high-speed steel held on an arbor by two powerful collars—nothing more; screws, small parts and inserted teeth being notable absentees in this tool.

There are four left hand spiral cutting edges, and every tooth is milled in the solid head. Adjustment is effected by loosening the rear collar and tightening the front collar, which procedure forces the two halves of the reamer head up the inclined surfaces of the arbor, obviating the necessity of shimming with paper or sheet metal.

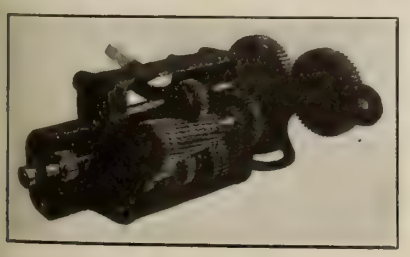


If desired, these reamers are furnished with right-hand spiral flutes for roughing purposes.

THE MORRIS NEW 16-INCH LATHE

THE accompanying photographs illustrate a new 16 inch quick change engine lathe recently placed on the market by the John B. Morris Machine Tool Co., Cincinnati, O. The machine, while conforming in general to the practice of the leading lathe builders, has a number of novel features incorporated in its design which go to increase the productive capacity of the machine. The tool is designed for heavy duty service and characterized by great driving power together with strength in details to balance same.

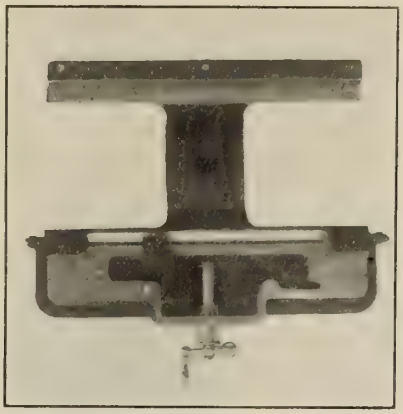
The driving cone, which is 3-stepped has diameters $7\frac{1}{8}$, $8\frac{5}{8}$ and 10 inches respectively for a $3\frac{1}{2}$ inch driving belt. The back gears are of the double fri



tion type with ratios sufficient to give ample pulling power on large diameters. The frictions in these back gears are of the toggle lever type, unusually large in diameter, and are fitted with an automatic adjustment for wear. The spindle boxes, made of phosphor bronze, are oiled continuously from large oil wells in

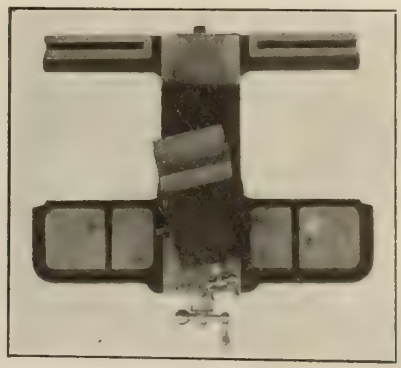
The Morris New 16-in. Lathe.

the pedestals. The front spindle bearing is $2\frac{3}{4}$ inches diameter by $4\frac{1}{2}$ inches long. The headstock is reinforced with an improved system of dropped longitudinal and cross ribs down below the shears of the bed. The reverse plate is carried on the outside of the head, and is a double-walled one-piece casting in which the studs for the gears are supported at both ends.



The quick change gear mechanism consists of the usual cone and tumbler gear combined with a novel system of sliding gears through which 45 changes of feed or thread leads are obtained with the use of 21 gears. All feed changes are obtained by means of the three levers shown on the front of the box, the one at the left being used only to secure the extreme range. The total range of the machine is from two to sixty threads per inch. The end of the lathe is fitted with the usual quadrant and quadrant gear for connecting up with the spindle, so that it is possible to put on change gears to secure any special thread which might be required within the above range, and making the machine capable of covering as wide a range of threads as can be obtained on any standard construction of engine lathes. A new feature in connection with this mechanism is the method of connecting it with the feed rod and lead screw. This is accomplished by means of a sliding gear operated by the knurled handle shown at the extreme right of the box, and is so arranged that when the lead screw is in operation the feed rod is at rest and

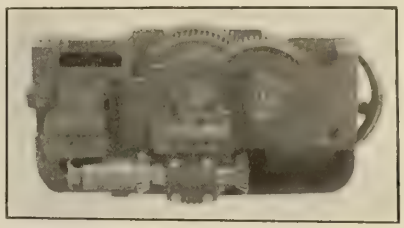
Detail—The Morris New 16-in. Lathe.



vice versa. This construction makes the quick change box a complete mechanism within itself and permits it being taken off the bed without disturbing the adjustment of the lead screw or feed rod. The apron is a one piece box section casting with all studs and gears supported in bearings at either end. It is supplied with the usual bevel gear reverse, which mechanism interlocks with the half nut, so that it is impossible to engage the lead screw and feed rod at the same time.

To overcome the difficulty usually encountered in engine lathes due to the operator's inability to manipulate the revolving knurls for engaging feeds, owing to the high speed at which they revolve, a novel arrangement of clutches is employed. The frictions are of the

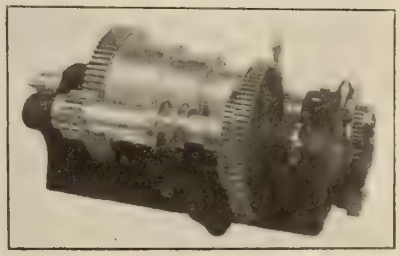
Detail—The Morris New 16-in. Lathe.



expanding ring type 5 inches diameter and engaged by means of a toggle lever movement which insures ample driving power under the heaviest cuts. The shifting mechanism for these frictions consists of a single crank handle shown on the front of the apron. When this lever is thrown to the right it engages the longitudinal feed, and when it is thrown to the left it engages the cross feed. Since this lever is stationary at all times it enables the operator to work up to a shoulder without the ne-

Detail—The Morris New 16-in. Lathe.

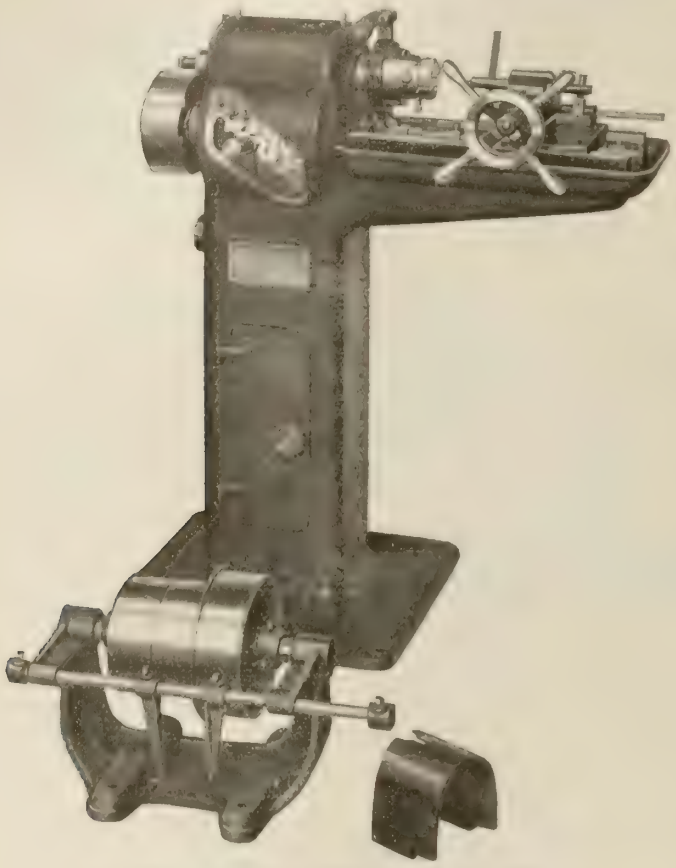
cessity of throwing out the feed and running up the carriage by hand, and in addition to this, it is in a particularly convenient position for the operator to manipulate at all times. Provision is made in the shape of a positive stop which makes it impossible to throw the lever from one feed to the other without first pulling out the plunger pin in the handle.



The carriage, which has a bearing $26\frac{1}{2}$ inches long on the bed, is carried on a

Detail—The Morris New 16-in. Lathe.

"V" at the front and on a flat surface at the back of the bed. It is held in position by a long flat clamp at the back and by means of two taper gibs at the front which bear on the machined surface directly under the front "V". These gibs from their location make it impossible for the carriage to lift or climb the "V" under any conditions, and at the same time will not throw the carriage out of alignment if not properly adjusted. The front "V" is unusually large, being $1\frac{1}{2}$ inches in width, and with the wide flat bearing at the back gives the carriage a total effective bearing area of from two to three times that usually found on lathes of this size. The bridge is very wide and drops down in a deep double box section between the shears. Since the ways for the tailstock are dropped down below the ways for the carriage, it is not necessary to notch the bridge for clearance, and thus its rigidity is maintained.



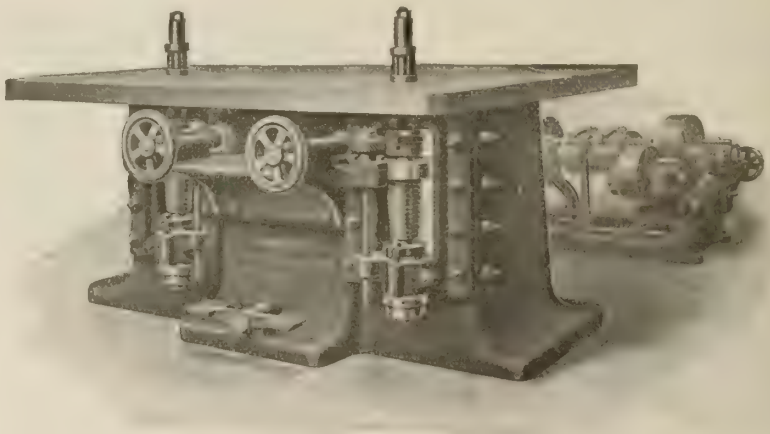
The compound rest is made heavy to withstand the strains imposed upon it by the modern high speed steels. The clamping device for the swivel is of a new construction operated by a single belt which is located convenient to the operator. The clamping mechanism consists of a "V" shaped clamping ring of a similar construction to that usually found on round column radial drills. This device in addition to being very effective leaves the bottom slide more rigid than it would be with the "T" slot turned in it and at the same time permits of very quick adjustment of the

Detail—The Morris New 16-in. Lathe.

compound rest. The tailstock is of massive box section and arranged with the usual type of set-over for turning tapers. Its spindle is of steel 2 3-16 inches diameter, and is clamped by means of a taper plug of the same construction as that usually found on the overarm of a milling machine. The tailstock is clamped to the bed by means of two large bolts coming up directly in front of and behind the tailstock spindle. These bolts reach to the top of the tailstock, where the nuts are in a convenient place for the operator.

The bed is 11¾ inches deep and 14½ inches wide, strongly ribbed with cross girths. The front girth, which is directly under the front spindle bearing, extends clear up to the top of the ways in order to resist the twisting strain on the bed at this point. The legs are set in from the ends of the bed, thus shortening the span between supports on the bed and making use of the familiar cantilever form of construction. The feed gears throughout the machine are made of steel and are considerably heavier than those usually found in similar machines; the lightest gear in this mechanism being 9 diametral pitch. That the machine is capable of continuous operation under heavy cuts, will be evidenced by the statement that it will handle, without any signs of distress, a cut ¼ inch deep by ⅛ feed in 60 point carbon steel at a peripheral speed of 75 feet per minute. The lathe swings 16½ inches over shears and 10 inches over the carriage, and with a six foot bed takes 2 ft. 8 inches between centres. With a six foot bed, the approximate weight is 2,100 pounds.

Geometric threading machine complete with countershaft (oil hood removed).



GEOMETRIC THREADING MACHINE

THIS machine has been especially designed to thread work that cannot be produced on the usual screw machine or turned out economically otherwise. It is intended to produce accurate work in quantity and should not be confused with bolt-threading machines generally. The pedestal and arms consist of a single heavy casting, through the head of which a hollow spindle of liberal diameter is mounted on bronze sleeve bearings. At its inner end, this spindle carries the standard Style D, Geometric Self-opening and Adjustable Die-heads, modified in design to meet the changed requirements of operation.

The die-head is held in a heavy cam sleeve pivoted in a yoke hung from the housing of the spindle. At its lower end this yoke is attached to a closing rod equipped with two adjustable stops. The forward stop is set to trip the die-head open, upon the completion of the thread, thus allowing the quick withdrawal of the work. The rear stop serves to re-close the die-head when the carriage is pulled back against it. This carriage is mounted on slides and is designed to be moved back and forth by hand. It carries a vise operated by hand wheel, and while designed particularly for rod threading, can be adapted to thread pieces of special form, simply by fitting it with a vise design for holding the work.

A liberal sized oil well is placed a short distance below the spindle in the pedestal, and carries an oil pump of the gear type driven by a round belt. This pump forces oil through the hollow spindle and at the opening on the die-head on the work, the oil returning to the well through a fine screen.

The range of the Geometric Style D Self-opening and Adjustable Die-head, with which this machine is fitted, is from ¼ to ¾ inch. Sizes obtainable are: ¼, 5.16, ⅜, 7-16, ½, ⅝ and ¾-inch, the machine being equipped with a change speed gear for adapting the speed of the spindle to the diameter of the work to be threaded. This gear is operated by a short lever dropping in notches corresponding to the various speeds, as shown by the illustration. An adjustable stop is provided at the off side of the carriage for gauging the length of

Fay & Egan extra heavy double-spindle shaper

the work. This is employed as a gauge in setting the work in the vise, and insures a uniform length of thread in every piece. A removable oil-guard placed over the die-head prevents it from throwing the oil about.

The range of diameters mentioned is obtained by the use of extra chasers or dies. To remove the chasers, push the carriage forward until the stop opens the die-head, exactly as when in operation. The chasers then may be readily lifted out by holding up on the knurled nut on the small projecting stud of the die-head. The form of the chasers is such that they are long-lived, and when worn out, may be replaced at a nominal expense.

The various speeds at which the Geometric Threading Machine has been designed to run for different diameters, are the result of a number of years' experience in this work.

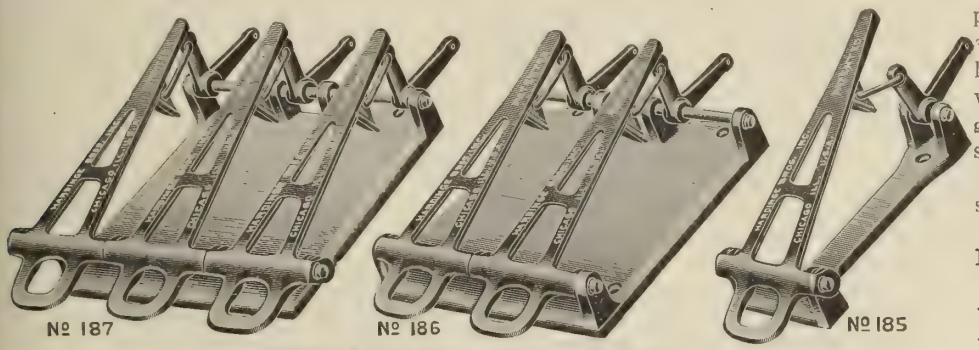
EXTRA HEAVY DOUBLE SPINDLE SHAPER.

WE are glad to be able to call attention to another new J. A. Fay & Egan Co. machine. This new tool is a double spindle shaper, designed to meet the most exacting requirements of car shops, and all kinds of woodworking plants, where heavy shaping is done. In the company's large illustrated circular treating of this machine, particular attention is called to the extreme high speed of the spindles, insuring perfect work and maximum output. The phosphor bronze taper bearings with continuous oil flow, permit the operation of the spindles on this machine at 7,000 revolutions per minute. The spindles are made of forged crucible steel, and mounted in rigid housings, which are fitted into planed gibbed ways, throughout their entire length. These housings, adjustable vertically by hand wheel (as will be seen in the illustration), operate through cut spiral gears, thus requiring no extra locking device. Each housing is independent of the other, and both spindles drop below the table.

Another valuable feature of this machine is the construction of the countershaft, on the base of which, cast in one piece, all the pulleys and belt shifters are mounted. This is new and distinctive of the Fay & Egan machine, and makes for the most rigid construction, as well as eliminating all assembling on arrival at destination. Adjustable independent idlers are provided to take up the slack in either belt, so maintaining the proper tension at all times. The column, a single cored casting, very heavy, and with broad floor support, is of such design that it is not in the operator's way, and supports the working parts with absolutely no vibration. The operator has perfect control of this machine at all times by means of the foot treadle at the front.

Further information concerning this machine may be had from the makers at 362-382 West Front St., Cincinnati, Ohio.

THE ALLEN HAMMER RIVETER.

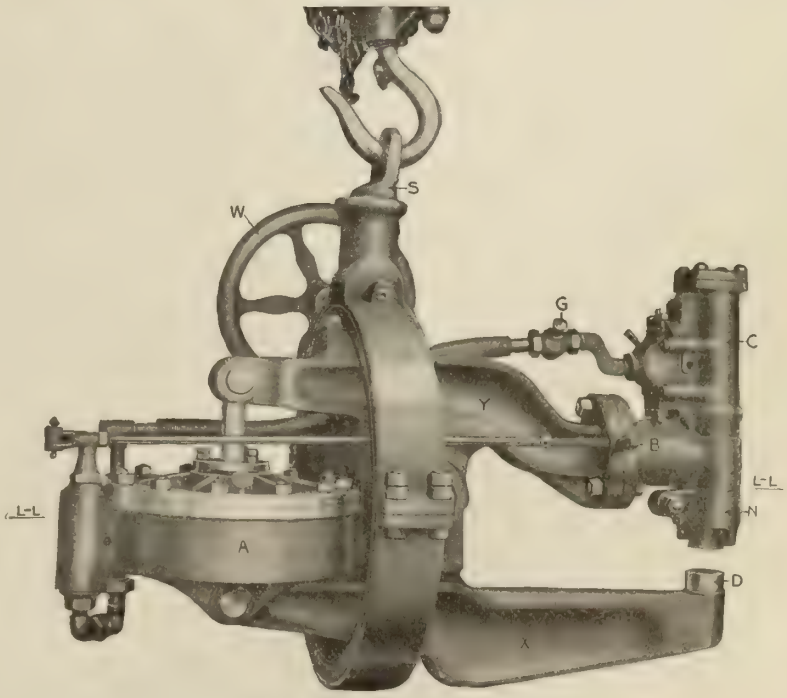


A notable addition to the line of hammer riveters, built by the John F. Allen Co., 370 Gerard Avenue, New York City, is shown in accompanying cut. This riveter, on account of its shorter reach and lighter weight, is intended for work beyond the scope of the regular Allen boiler riveting machines, and should have a wide application. Its reach is 15½ inches, and it is sufficiently powerful to drive rivets from ⅜ to 1 inch diameter.

In operation the work to be riveted is placed so as to bring the rivet head on die "D" with the free end of the rivet pointing toward the axis hammer cylinder "C." Upon moving handle "B" toward "C," air is admitted to cylinder "A." This closes arms "X" and "Y" and with a pressure of about 4,000 lbs., firmly secures the plates to be riveted, between die "F" and nozzle "N."

When button "G" is pressed, air is admitted to cylinder "C." This causes the hammer to strike the end of the rivet a series of swift blows, heading the rivet in a few seconds. Upon releasing the pressure upon button "G," the motion of the hammer is arrested. Moving handle "B" toward the rear of the riveter, at once opens arms "X" and "Y" and releases the plates, which are moved immediately upon inserting the rivet into position and the riveting operation repeated.

The machine is in balance when suspended from hook "S" and can be swung in any direction. It turns on its long axis "L-L" by means of the handle wheel "W," which operates a worm engaging a worm wheel enclosed in the supporting ring "R."



This riveter operates on air at a pressure of from 60 to 100 pounds.

Hardinge automatic locking foot treadle.

HARDINGE AUTOMATIC LOCKING FOOT TREADLE.

IT will be noted that when the foot is pressed down, as in Figs. 186 and 187, the upward pulling of the wire locks the

New Allen hammer riveter.

treadle, and by simply pressing on the heel part, the treadle is again released, making the operation just as easy as if there were no locking feature. The device seems attractive and useful for application to such machines as are started by foot; further, it enables the operator to manipulate the treadle at will, according to requirements.

Hardinge Bros., Lincoln Avenue, Chicago, are the manufacturers of this treadle.

Shop Kinks and Methods*

By William Hall.

THE matter of shop kinks and methods as applied to railroad shops and other manufacturing establishments is a factor to be counted on, when considering the efficiency, not only of our great and up-to-date shops, but of the small and isolated places, and more especially the latter, for in the larger shops it is less difficult to get the proper tools necessary for a job. Until everything mechanical has been improved to its utmost and universally adopted, there will be call for shop kinks, and individual effort in devising them.

Kinks Afford Scope for All.

Great inventors, like poets, are born, not made. We can't all be Edisons, any more than we can all be Byrons or Tennysons, but very happily it does not require a great inventor for most of our shop kinks, nor is it always the most intricate piece of mechanism, that is the most useful and counts most towards efficiency. More often the home or shop-made tools, the result of a few hours thought, the tools that can be made use of every day, are those to give us the best all-around results. These kinks or short cuts, if you please are designed for the purpose of reducing exertion on the operator's part, and decrease the time on and expedite certain operations. All kinks, however, are not applicable to every shop for what would be practical in one could not be used in another owing to local conditions.

Lack of Encouragement.

A great many more shop kinks would be designed and used were it not for the prejudice of some men in authority. This same prejudice has killed the ambition and aspirations of many a good man; probably I should have used the word selfishness—the terms, however, are synonymous. A man may be intensely earnest in endeavoring to produce something very practical and very efficient, but his efforts are not appreciated; he receives no encouragement, hence his work counts for nothing. I believe that the practice of devising shop kinks and methods should be fostered and encouraged to its fullest extent, for it will be to the best interest of all concerned. I also believe in giving every man his honest due. If a kink has been developed from a hint or suggestion from some workman, however humble a sphere he may be filling, let him get the credit, for possibly if he had the facilities at his command he could have brought out the kink himself. I believe that more kinks would be published, were it not for the fact that all af us are not draughtsmen, and, therefore, are unable to procure tracings or photographs to send to the editor of the shop kink section of our magazines.

Services Rendered by Kinks.

That great service is rendered by these various and numerous kinks is without question. There is great saving of energy on the part of the operator, and the efficiency of the shop is increased according to the merit of the kink designed and adopted. I have said that it is often the the simple little kink that counts for efficiency, and as an illustration will cite a small tool designed by the writer, for the purpose of testing crank pins. Sometimes in tramming an engine in the running sheds, we find the pins do not coincide with the main or wheel centres, indicating that one or more pins are either sprung or not quartered correctly, and in order to find this out, wheels must be removed and placed in a quartering machine to find out which pin or pins are out, requiring the services of from four to six men, but the simple kink designed by the writer eliminates this difficulty; pins can be tested without removing the wheels, and the device is so simple that it can be operated by any intelligent apprentice.

Another case I recall, where, being necessary to finish a set of shoes and wedges from the rough, the planer hand would finish each shoe and wedge separately in a chuck. By the introduction of a simple angle-iron, five shoes or five wedges were finished in one operation, the number being limited only by the length of the planer bed. This was on a single-headed planer.

I could cite numerous cases just as simple, and equally efficient, such as using arbors for planing cross-heads, instead of removing the piston for that purpose, and the introduction of frame spreaders made from piping, instead of using heavy jacks, thus not only increasing the efficiency of the men and the shop, but eliminating the element of danger of a heavy jack falling and hurting some one.

Kinks as an Aid to Shop Efficiency.

The gain in efficiency of a shop using kinks is difficult to estimate, as the gain depends upon the kinks themselves and local conditions, and may vary from 10 to 500 per cent.

It has been said, that "necessity is the mother of invention," and many of our shop kinks are the results of some hard thinking on the part of some man who was up against it. Others, again, have been the result of accident; in their case, results have come unsought.

*Abstract of Paper read at the General Foremens' Convention.

SAFER, QUICKER AND CHEAPER RAILROADS.

C. Reginald Enock, in introducing the subject of "Necessity for Safer, Quicker and Cheaper Railways," in a paper read before the Society of Engineers, London, England, argued that the capabilities of the ordinary steam railway do not keep pace with the requirements of the times; that there are too many accidents; that traveling is too slow; the cost of construction too heavy; that freight and passenger rates are too high; labor insufficiently paid, and dividends less than they should be. He pointed out that the mountainous regions of the globe are still undeveloped, due to heavy cost of railway construction. He showed that the heavy cost of English railways is largely due to land purchase. He considered that radical changes in design and construction are now called for, in the interests of safety, rapidity, and economy. He brought forward a proposal for a new type of safety telescopic buffer carriage, to minimise shock and loss of life in collision, and suggested a special lookout man on express engines.

He discussed the possibility of evolving a new type of railway altogether, and brought forward a plan for light overhead railways, with single motor or electric vehicles traveling at high speeds, with special provision against derailment, by additional horizontal wheels. If such a type were found practicable, the present great cost of railway construction would be lessened, as land for right of way would not be rendered useless for agricultural purposes, and embankments, cuttings, bridges, tunnels, drainage, ballast, sleepers, telegraph poles, and other matters would no longer be necessary. He urged that national experiments should be carried out on a specially equipped site, in order to give greater scope to inventors and to evolve improvements; and suggested that enquiry might be made into the possibility of a combination of railway and aeroplane.

He concluded by saying that both engineers and railway managers must come to the rescue of society with improved methods, and greater ingenuity and economy.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol VII. November, 1911 No. 11

THANKSGIVING DAY, 1911.

WE join with our readers in giving thanks to a bountiful Providence for not only providing industrial prosperity, with its labor and recompense to our steadily increasing population, but for averting that class strife and bitterness, which, with its disastrous consequences, has marred the fair records of other lands during the past year. The outlook is for a continuance of equally good times to that which we have been experiencing.

Much prosperity, we all know, is not conducive to increased contentment, because a propagator of selfishness. Unless, therefore, those who direct and those who serve temper it by the cultivation of tolerance and respect for each other in their shortcomings, Canada, too, will have her future Thanksgiving Days disfigured by strife and class bitterness. Needless to say, we hope for many happy returns of the day.

CANADA'S ACCIDENT RECORD.

INDUSTRY'S toll of death and serious injury is reaching to figures somewhat higher than most of us would care to give credence, did they not have the stamp of officialdom. In another part of this issue will be found the Department of Labor returns for the month of September. There were 58 fatalities and 122 serious injuries recorded. The question naturally arises: Is everything possible being done to prevent and minimize these occurrences? Is there contributory negligence on the part of both employer and employe? Is each taking the necessary precautions for their prevention, as they should? or are they leaving their best interests to that most unsatisfactory of recourses—legislation? Prevention is better than cure—yes, and the legislation cure is worse than the disease.

Much, we admit, is being done in the matter of installing safeguards on manufacturing equipment, but much more can be and should be done. The desire to keep down expenses and increase profits on the part of employers contributes, together with the bait of increased remuneration for the employe who takes the "last ditch," as it were, in his efforts, to more or less neglect of the duty that the former owes to the latter, and each to themselves and those dependent upon them.

Compensation for injuries, fatal or otherwise, is meet and right, although always unsatisfactory from every point of view in its ultimate determination. Protection is what both sides will find to be the best solution, and no man is a sufficient protector of himself or of those in his care, who neglects to keep alive the instinct of self preservation and usurps its place with a greed which seeks to extract the last cent that physical endurance permits. Efficiency, carried too far, will, we fear, cultivate concentration of effort in a narrow groove and kill observation and alertness over that wide range to which our natures aspire and for which they are fitted.

THE CARE OF EMERY WHEELS.

A FEW weeks ago, in a Toronto foundry, a man was killed by the bursting of an emery wheel, near which he was working. Such accidents are, fortunately, rare, though we are surprised that they do not occur more frequently, in view of the ignorance displayed in so many shops of the proper way to care for emery wheels. Take the above accident as an example. At the inquest, the jury found that the wheel had a flaw in it and was unfit for use. This may or may not have been the case, but it came out in evidence that when the wheel had glazed, the man in charge, instead of using an ordinary dresser, had hacked the face with a hammer and chisel. Such treatment would be sufficient to injure any wheel, and we should not be surprised to find that a crack was thus started which was the direct cause of the accident.

When visiting foundries and machine shops, we constantly see emery wheels fitted with side washers which are far too small to give adequate support. About a month ago, we saw a glaring case of this kind, and in conversation with the foreman, learned that a wheel on the same machine and running under similar conditions had burst about a year previously, on which occasion the said foreman was struck on the head by one of the flying fragments and seriously hurt. It is said that "a nod is as good as a wink to a blind man," and this gentle hint was as effective as either in this case, for on emerging from the hospital, he proceeded to equip the grinder with a new wheel—and used the same old washers again!

The manufacture of abrasive wheels has reached a high pitch of perfection, and as they are all tested to run at much above their working speed, it is seldom that one bursts, through an inherent defect, if purchased from a reliable maker. Nevertheless, every precaution should be taken to ensure their safe operation.

AN AWARDS SCHEME.

THE article appearing in another part of this issue sets forth the advantages accruing through the evolution of "kinks, methods or devices" from the brains of workmen in every field, department and station. More industrial development than many of us care to admit has been due to the mechanic and helper, yet little credit and reward of such humble genius has been apparent. We purpose, in an early issue, to tell our readers of the operation of an "Awards Scheme," whereby employes of every grade found profitable outlet for the display of intelligence in their daily work.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

MOLDING AN UNUSUAL BAFFLE PLATE.

By John H. Eastham, Montreal.

ALONG with contracts for ordinary work, most jobbing foundries receive every now and then, an order for a casting or a series of castings a little more complicated than usual. In this category, the baffle plate here described may safely be placed, and although of

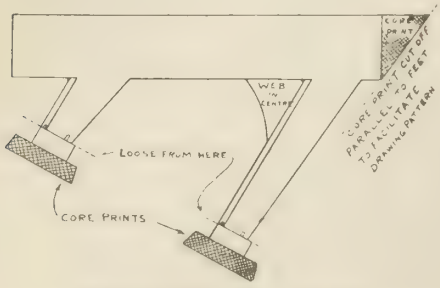

Fig. 1.—Baffle Plate Pattern.

no great size, it is well worth description.

Method of Molding.

Figs. 1 and 2 show side and end views of the pattern, which was placed feet upwards on an ordinary flat board, and the cheek or mid-part first rammed up. A parting was made at the face of the core prints, the loose pieces drawn out, feet cores placed in position and securely spiked. The drag was next rammed in the usual way, care being taken when venting, not to strike the cores or that part of the mold from which the loose pieces had been withdrawn. The job was then rolled over, the parting made, and the cope rammed up and removed.

Owing to the angle at which the feet were placed, great care was required in drawing the pattern, the print at the end being cut off parallel with the feet to facilitate the operation. The core at this end squares up the end of the casting as may be seen in Fig. 3, which shows the completed mold.

Emergency Parting.

The parting made below the feet was for emergency use, as in the event of loose sand falling down the mold, the shape of the latter would have made thorough cleaning out impossible, except by the removal of the cheek and cores.

The straight irons bedded in the overhanging corners at A, A, A, A, prevented the sand from pulling up during withdrawal of the pattern, and also washing and scabbing when the mold was poured.

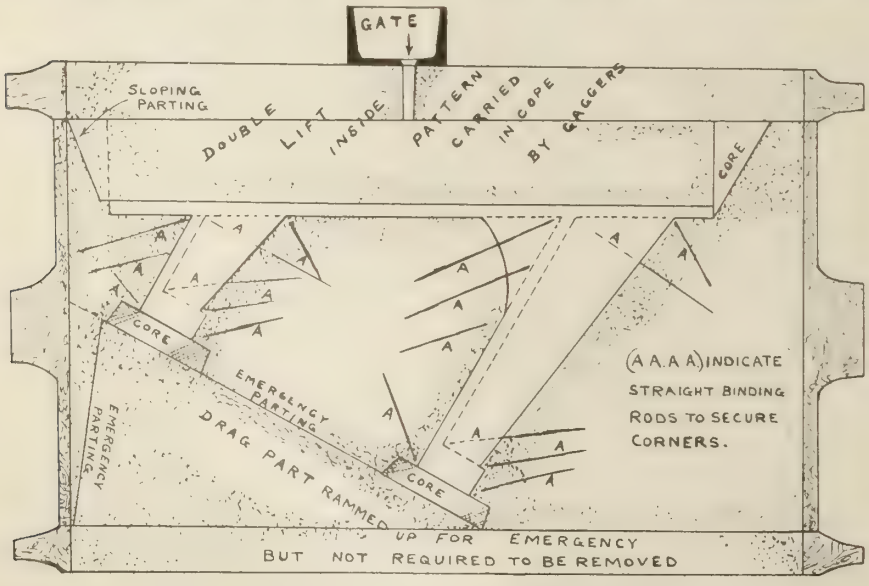

Fig. 3.—Baffle Plate—Completed Mold.

DISK GRINDING SECRETS.

"There is no secret or mystery in modern disk grinding or disk grinding processes. If your competitor is at all alive, he knows—or can if he wants to—whether or not you operate a disk grinder.

Time was, however, when the first disk grinders were installed that their owners did not want anyone else to know there was such a tool on the market. They guarded their disk grinder with envious eyes for fear their competitors might learn of this labor-saving tool.

But that time has passed. Trade papers, advertising, salesmen and all bearers of new 'thinks' make it impossible to keep the disk grinder hidden. It is needless to say we are doing our best to make it public property.

This leads us to the question, 'Is it worth while to try to keep secret your methods of machining?' This has been tried—and is being tried to-day—by many manufacturers, but generally with little success. As long as your method requires you to employ help your secret is bound to leak out. Your employes are apt to leave you, either in good or bad graces, and with them goes your secret.

Of course, this matter is the manufacturer's own business, but it has been demonstrated beyond doubt that those

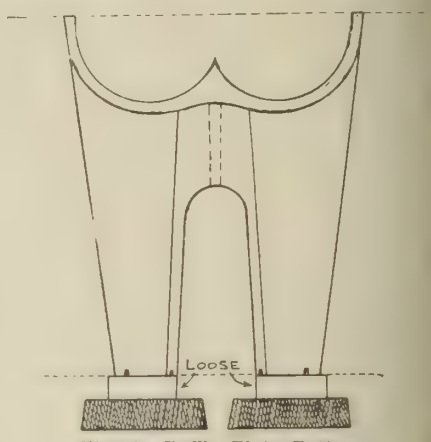

Fig. 2.—Baffle Plate Pattern.

who invite visitors into their plant and show them how they do things are just as prosperous as those who do not. This latter type may be likened to an ostrich which buries only his head in the sand and thinks he is entirely under cover. If you have tools, methods and devices upon the exclusive use of which your success depends it would be far more satisfactory to have them patented."—The Gardner Grinder.

GREEN SAND, DRY SAND. LOAM and CORES

By Joseph Horner.

IF this subject is considered on broad lines, there is no question as to the extent of field covered by the various sand preparations. There are, however, considerable differences of opinion held by individuals, as to the relative utility of each in special cases. As in so many other matters, the border lines which define the sphere embraced, are not of a sharp and definite character, therefore, much overlapping occurs. One foreman will use cores extensively in a class of work which another will treat in green sand. One will prefer dry sand, another will employ green, and a third will use dry sand instead of loam. Sometimes it is a question of relative expense, but more often it is one of general soundness of the castings pro-

duced, their neatness of finish, or the lessening of the risk of wasters. In some cases, choice is determined by local conditions, such as capacity of drying stoves, tackle available, and so on. The broad outlines of the separate spheres being more or less well defined, these with modifying conditions will now be considered.

Green Sand.

This occupies by far the largest place in foundry work, the reason being fairly obvious. In the first place, it serves excellently for perhaps quite eight-tenths of the total work done, and is easily manipulated. It affords a cheap method of working, because when a mold is made, no further drying is necessary except in some few cases, and then only a mere skin drying. It is convenient, because a large range of mixtures is obtainable, ranging between weak and strong for lighter and heavier work, and for different sections of the same mold, subject to less or greater pressure. Green sand mixtures have features in common, as follows:—They are loose and are rammed green or moist; they are not dried, the molds being poured into, without change of condition from that in which they were rammed.

Suitability of Mixtures.

The suitability of mixtures, each for its own special line of work, depends on three main conditions. These are the character of the mixture, as determined by the proportions of the open, loose and free, or close and clayey character of its constituents, without reference to these qualities being a result of chemical differences; by the amount of water present, and finally by the manner and degree in which the ramming and venting are done. Only a molder perhaps fully understands in how large a degree the soundness and smoothness of the skin of a casting are dependent on these two conditions. Too loose ramming entails lumps, too hard ramming, scabs. Insufficient venting in almost any case results in blows and sponginess, and the harder a part is rammed, the more freely should venting be done. The few exceptions to the need for venting only occur in small molds made of very open sands.

Green sand mixtures are rammed chiefly when enclosed in boxes. The box filling is old sand which has been used over and over again, having been turned out of the boxes after casting, and rewatered and mixed for repeated service. New sand, a facing sand mixture, is rammed directly against the pattern, and the old or floor sand is used for filling up, hence termed "box filling." The facing sand only occupies from about 1 to 2 or 3 inches thickness, and increases with the dimensions of the mold It contains ground coal dust or charcoal to prevent sand burning. The carbon ignites and burns away, leaving the sand honeycombed and porous, while the gas generated forms a film interposed between the molten metal and the sand

Reasons for Non-Universal Adoption.

The reasons why the utilities of green sand molds are not of universal application may now be noted. First, the sand, though rammed, is too loose and weak for some molds in which numerous sections stand out in cantilever fashion, and are thus liable to become broken off and washed away by a heavy flow or rush of metal. Much assistance can be afforded such sections by rods and nails, but their use is often too limited to be reliable. The larger the mass of intricate molds the greater are these risks, and although a strong mixture of sand be used in such molds, the body of which would be rammed with ordinary sand, the risks of wasters are too great to be taken. This being the case, green sands are wholly discarded for another material.

Another thing, entailing some risk in green sand work, is the presence of a large number of cores. The risk is cumulative, the numerous cores and vents being liable to cause trouble in addition to the mold proper, due to the large aggregate amount of gas generated in pouring. Intricate steam cylinders of large dimensions are cases in point. Again, where the risks of actual wasters may be slight, there are others, such as lumpiness of surface, general or local sponginess, roughness of skin, and slight scabbing of castings, which founders of repute do not like to send out, and which many inspectors would condemn. In face of such risks it is better to abandon green sand and employ a rather more expensive way of molding

Dry Sand.

This is a strong sand mixture containing horse manure. When dried, it is hard in mass, though rather fragile in weak sections. It offers a firm surface against the pressure of metal, and little gas is developed at casting, because the moisture of the water used in mixing, is dried out in the stove before the metal is poured. It is, therefore, a safe mold, though more costly than green sand, due to the necessity for drying it.

The differences to be noted in the working of dry sand, besides that of drying, are of three kinds. First, the ramming must be harder, as hard as can be done. Second, the venting is supplemented and helped by the burning out of the particles of hay in the horse manure during the drying of the mold. Third, the joints must be finned, i.e., pressed down with the trowel after delivery of the pattern, and before drying, for unless this be done, the joints will be crushed and will fracture on closing the mold Such a contingency does not occur in green sand, because it yields slightly, but dry sand is too hard and rigid to yield. Finning the joints has the effect of throwing the sand adjacent to the edges out of actual contact, and a very slight fin results in the casting, but this is of no consequence.

Loam Work.

This occupies a sphere which is narrowly defined. With very slight exceptions it is retained for work mainly cylindrical or circular which is too large to be made from a pattern on account of the cost of the latter. There are of course, fittings more or less numerous, not circular, such as feet, flanges, steam chests, and the like, and for which pattern parts have to be made. The main cylindrical or circular sections are swept up with boards, against loam plastered on and sustained by brickwork. Loam is daubed and built against the fittings which are also supported by brickwork built to their outlines with the necessary loam clearances.

Loam is also used for sweeping-up large cores around a vertical axis against brickwork, also for cores on a horizontal axis, laid around a central core bar, with hay or straw ropes to bind the loam together, and to make up thicknesses. Often the thickness has to be made up in some section with plates threaded on a central bar, and having the interspaces filled with haybands and loam. Again, loam is used for sweeping-up patterns to be molded in green or dry sand. This is done when work is too long and too small in diameter to be swept-up on a vertical axis. Loam patterns may be plain, but much more often they carry fittings of wood, just as though the main body were of wood instead of loam.

Loam is of one mixture, but is ground and sieved coarser or finer according to the location in which it is to be used. Coarse loam is employed for roughing, finely sieved loam for finishing coats. All loam contains quantities of horse manure. A strong sand is used mixed with water, and dried thoroughly in a stove. Usually it is self-venting, but awkward corners and angles are vented with the wire.

The Problems Involved in Machine Tool Standardization*

By L. P. Alford

The writer shows in this paper that as well as standardization of product being of immense advantage in manufacturing, equally beneficial results are achievable from a standardization of processes and tools by users.

STANDARDIZATION of product is a necessity in manufacturing. It is the starting point in every attempt to produce great quantities of parts cheaply and uniformly. The advantages are readily recognized. There are similar advantages in the standardization of processes and tools used in manufacturing, and this broad fact is the reason for this paper. The problem of standardizing machine tools is very important. I propose treating it so as to establish the principles which should be followed to obtain the desired uniformity in details, rather than go very far into the details themselves, except by way of illustration.

Nomenclature of Machine Tools and Parts.

Before beginning my argument with reference to mechanical details I must refer briefly to the nomenclature of machine tools and their parts. You have a committee which is considering the question of standardizing the names of machine tools. Permit me to say that I am in full sympathy with this movement and hope for a speedy report and action by your body. But is there not a wider field, that your committee might consider, than merely the generic names of machines? Why not take up the names of individual parts? No argument is needed to convince you of the confusion that now exists. Take the common word dog. There are probably as many varieties of inanimate dogs as there are species of canines on the benches of the average dog show.

What is the distinction between a table and a platen, between an arbor and a mandrel, between a bed and a base, between a pillar, a post and a column? What is a jig, a fixture, and so on? Lest you think I am wandering from my subject, I hasten to point out the connection. The foreign user must not be forgotten. Whatever simplifies the descriptions of machines, facilitates translation and comparison, and is a direct aid to him in getting a mastery of the situation. In the interest of technical accuracy, it is very much to be desired that a reasonable uniformity should be established in the names of machine parts.

*Read at the New York meeting of the National Machine Tool Builders' Association.

Important Principles in Standardization

Turning to the machines, there are six important principles in standardization, which I have formulated, as follows:

1.—Standardize corresponding designations and capacities, and establish a method of power rating.

2.—Standardize devices for holding cutting tools.

3.—Standardize devices for holding work and fixtures.

4.—Standardize operating movements.

5.—Standardize parts concerned in the setting-up of machines, with reference to the permanent shop equipment.

6.—Accept the geometric progression as a fundamental requisite in designing feeds and speeds.

The application of none of these principles will introduce a radical change in design, for, on the contrary, either through action by this association or through a process of natural development, uniform features can be pointed out substantiating the importance and setting a precedent for the application of each principle.

The First Principle.

The first principle aims at a standardization of corresponding machine designations and capacities, and the establishing of a method of power rating. In 1903, action was taken by a number of milling machine manufacturers, establishing the maximum feed travels for various sizes of knee-and-column milling machines. For example, the maximum

feed travels for a No. 2 Universal machine were fixed as follows: Longitudinal, 25 inches; cross, 8 inches; vertical, 18 inches. This was a start toward standardizing designations and capacities. The resulting uniformity is of advantage to the buyer in comparing the various makes of machines designated as Nos. 1, 2, 3, 4, etc. But this is only a beginning.

To develop the point, let me ask what is a 14-inch, 6-foot bed engine lathe? To answer my own question, I don't know. From data that has been gotten out, comparing some of the dimensions of a number of 14-inch, 6-foot bed engine lathes, it is found that the diametrical swing over the bed ranges from 14⅛ to 16⅛ inches; the swing over the plain carriage from 7½ to 10¾ inches, and the maximum distance between centres from one foot six inches to three feet three inches.

From the user's standpoint, it is as important to know the diameter that can be swung and turned over the carriage as it is to know the maximum diameter that can be swung over the ways, and the length of the bed is of no more interest than the height of the lathe hand who operates it. A similar argument can be presented for other kinds of machines, but would only serve to unnecessarily lengthen this discussion. Is there not an opportunity to bring about reasonable uniformity of corresponding designation and capacity, making these descriptive?

Question of Power Rating.

Turning to the question of power rating, the user should have some means of distinguishing between the relative capacity for removing metal and mechanical efficiency of machines of the same dimensional capacity. If he asks for bids on a 20inch 10-foot engine lathe, and in one case is quoted $600 and in another $450, he should have some means of knowing that the difference in price represents a difference in metal-removing capacity of the tool. Let me call attention to the phraseology that I have used in connection with this point:—To establish a method of rating rather than standardize ratings themselves. Development is giving us light-powered and heavy-powered machines; each kind has its field, but there should be some way to differentiate them except by name.

The Second Principle.

The second principle refers to standardization of devices for holding cutting tools. The small tool equipment of a shop represents a large investment. The more adaptable this equipment is, the fewer pieces there need to be in use; and the greater the number of hours each small tool can be at work, the greater the operating efficiency of the shop. The interchangeability of lathe tools and tool holders throughout the tool posts of all lathes of a given size, the interchangeability of milling cutters and their collets among machines of different makes, the interchangeability of drill chucks throughout all the drilling machines of a given department, and so on, represents a real increase in efficiency which is so apparent as merely to need mention to be recognized. To show that this principle has already influenced design, I have but to refer to the taper of the hole in the spindles of milling machines. For the No. 2 milling machines, whose dimensions are tabulated, all had the hole in the spindle conforming to Brown & Sharpe's No. 10 taper. Similarly, for the No. 3 milling machines, the spindle taper was found to be uniformly Brown & Sharpe's No. 11. Again, the Morse taper is extensively used in drilling machine spindles, and in the ten 14-inch engine lathes investigated, the majority of the tools' post slots were found to be made for ½ x 1¼ inch tools.

The Third Principle.

The third principle proposes to standardize devices for holding work and fixtures. The arguments presented in favor of standardizing the devices for holding cutting tools apply here with even greater force, for the devices and fixtures for holding work are more expensive as individuals than are separate cutting tools. Consider the advantages of having chucks interchangeable through out all of the lathes of a given size in a lathe department, or consider the advantage of uniform T-slots throughout all kinds of machine tools of relative

Dimensions of Six No. 3 Milling Machines

similar sizes. A milling fixture can then be used on any milling machine of a given number, holding-down bolts can be standardized as regards the sizes of heads, with the full assurance that they can be used on a milling machine, or drilling machine, or planing machine, or lathe, as the case may be. In addition to the enormous saving in original investment and increased flexibility of the equipment, there is an attendant saving in the time required on the part of the workmen to find devices that can be used.

The Fourth Principle.

To show that something has been done in recognition of this principle, I have but to refer to the table slots of milling machines. Of the milling machines investigated, the table slots were uniformly $\frac{5}{8}$ inch. The fourth principle refers to the standardization of operating movements. Rapid repetition work depends very largely upon the sense of touch of the operator. Frequently repeated movements become, to a great degree, involuntary. It, therefore, follows that a standardization of the operating movements of machine tools will contribute to an operator's speed by making his motions, to an extent, involuntary and permitting him to change from one make of machine to another without any disturbance to the habits that he has formed. On all standard lathes, the same direction of motion of the foot-stock handle should advance the spindle toward the head. Similarly, a definite direction of motion of the hand wheel on the carriage should advance the carriage toward the head, and so on, for the other hand-operated movements.

To show that this principle has been recognized in the engine lathes investigated, the direction of motion of the operating handles was uniform to produce a correspondong movement of the operating parts.

The Fifth Principle.

The fifth principle sets forth the standardization of parts concerned with the setting-up of machines with reference to permanent shop equipment. There are only a few points to be considered here, such as the spread of the bolt holes in the feet of the countershaft hangers, the drop of the shipper rod, and for motor-driven tools, the dimensions of the motor feed pads. I understand that a committee of your association has consulted with a committee of electrical machinery manufacturers in regard to this latter feature, but that thus far, a working basis has not been reached. I need not dwell upon the advantage to the user in being able to buy a machine that meets his needs from a machine tool builder, and a motor adapted to the machine from an electrical machinery manufacturer, which he can assemble himself with every knowledge that they will fit.

The Sixth Principle.

The sixth principle refers to an acceptation of the geometric progression as a fundamental requisite in determining relations throughout the chosen ranges for feeds and speeds. I have reason to believe that this principle is very generally recognized among you, especially among those producing milling machines, but there seems to be a wide difference in the ratios aimed at. Personally, I am not in a position to make any definite recommendation along these lines, other than to state the general principle.

To make my argument complete, it is evidently necessary to prove that a lack of uniformity exists in connection with the features covered by the principles outlined above, and at the same time that these differences are of such a nature as to indicate that uniformity can be established. To meet this requirement one of my associates has prepared four tables that form an appendix to this paper. Two refer to lathes and two to milling machines, and give, respectively, an analysis of many of the features capable of being standardized for 14-inch and 20-inch lathes, No. 2 and No. 3 milling machines.

The following lists of features to be considered for standardization are for the four fundamental machines, lathes, planers, drilling machines and milling machines. This does not imply that standardization cannot be carried on in connection with some other machines, but the limit of time prevented a consideration of them. However, the principles laid down are of such a nature that they can and should be applied to all classes of machine tools that are of a fixed type and made by a number of builders. The real work of determining dimensions is a long, tedious task, and cannot be done in a weak-kneed, faltering manner. Personal experience in the work of standardization has taught me that the difficulties in the way are always magnified. The way is easily found if there is a will to do. What follows is suggestive only.

Engine Lathe Standardization.

Designations and capacities might be linked together by giving three dimensions: First, the swing over the ways; second, the swing over the plain carriage; third, the maximum distance between centres. Thus, a 14-inch 6-foot bed engine lathe would become, say, a 14x8-inch x 3-foot engine lathe. The maximum swing over the ways should be fixed for each nominal swing; the other dimensions to be exact. As a suggestion merely, is it necessary to have so many nominal sizes of lathes as are now built and listed? As now arranged, these sizes roughly form an arithmetical progression, having a common difference of two inches. Has anyone considered arranging these sizes in a geometric progression with the direct purpose of reducing their number? If anyone is interested in this speculation let him start a progression with ten inches and apply the ratio 1.2.

A standard method of power rating might be to give the horsepower of the driving belt for the machine; this power to be figured by means of a determined formula with determined factors for single, double and triple belts. This same rating could apply whether the machine was belt-driven or motor-driven; for a given type and size of machine is usually built for both methods of applying power. This will permit a careful designer to develop a design and have a proper relation between power and rigidity. It will also permit the user to compare mechanical efficiencies.

For each nominal size of lathe the following details of designs should be standardized: The diameter, thread, and length of spindle nose; taper of hole in spindle; diameter of hole through spindle; taper of the centres; hole, keyway, face, pitch and kind of teeth of change gears for the ordinary screw-cutting type; number of threads per inch of the lead screw; size of T-slots in wings of carriage, direction of motion of operating handles, controlling movements of foot-stock spindle, carriage, tool block and compound rest.

Vertical Drilling Machine Standardization Features.

Features of vertical drilling machines that should be standardized for each nominal size are: Dimensions of table and finished surface of base; distance from centre of spindle to face of column; method of power rating; dimensions of the spindle nose, taper of the hole in the spindle; number, arrangement and size of T-slots in table and base, maximum distance from spindle to table and from spindle to base; direction of motion of operating handles.

Planer Standardization Features.

The features to be standardized in connection with planers are: A method of rating; method of stating capacity; number and size of T-slots in the platen, and dimensions of reamed holes in platen and direction of motion of operating handles.

Milling Machine Standardization Features.

In the planing machine, drilling machine, shaping machine and lathe, we have a precedent for a form of designation that of itself indicates capacity. Is there any good reason why milling machines should not be styled in similar manner? To illustrate, is not the designation a 25 x8x18-inch universal milling machine better from the viewpoint of conveying information, than to say a No. 2 universal milling machine?

Features to be standardized in connection with milling machines are: Designation and capacity; a method of rating; a length and width of working face of table; maximum distance from centre of spindle to table; thread on nose of spindle; diameter of nose; taper of hole; width of slot in clutch end; diameter of clutch end and distance from face of column to end of spindle nose; and taper of hole of spindle of vertical attachment and index head; diameter of over-arm; distance from centre of arm to centre of spindle; diameter of bore for outer arbor bearings; width of face of pillar and solid angle of edges; distance face extends above spindle centre; number, size and spacing of table slots; diameter and thread on draw-in bolt; general position and direction of motion of operating handles.

Inter-size and Inter-class Standardization.

Thus far my argument has been directed toward standardization within the general limits of a given size of a given kind of machine. We must also consider the advantages of inter-class standardization. Although this discussion cannot be carried very far until detail dimensions have been tentatively determined upon for the various sizes of the various classes.

The establishing of a standard method of power rating has been touched upon. It is evident that such a method would apply to all sizes and all classes of machines. Turning to details of design, a $\frac{5}{8}$-inch T-slot should have the same dimensions whether it is in a milling machine table, a drilling machine base, a planing machine platen, the wings of an engine lathe carriage, or the table of a shaping machine. If there is an advantage in being able to exchange chucks throughout the individual machines of a lathe department, is there not an added advantage if these same chucks can be used on certain sizes of milling machines? To put it a little more concretely, why should not the spindle noses of 16-inch engine lathes and No. 2 milling machines be identical, and again why should not the noses of No. 3 milling machines and 20-inch engine lathes be the same?

Motion of Operating Handles.

Turning to our fourth principle of standardization, should not the general position and direction of motion of the operating handles of a 14-inch lathe correspond with those of a 20-inch lathe? Should there not be similar uniformity between a No. 2 milling machine and a No. 3 milling machine, and so on?

General.

Referring to our fifth principle of standardization, should not the space of the holes in the feet of countershaft hangers for the countershafts of approximately the same weight and subjected to the same stresses, be uniform without reference to the machines they are used with? The advantage of such standardization in aiding the locating, spacing, and setting-up of countershaft stringers is apparent. Again should not the pads for the feed of a three-horsepower motor to be applied to a lathe be identical with those for a similar three-horsepower motor to be used on a milling machine?

As another general point, no screw or other part should be tolerated whose travel is of such a length that a hole must be cut in the floor to accommodate it. Machine users cannot countenance the cutting of holes in shop floors, particularly in buildings where the materials of construction are fire resisting.

It may seem to you that I have mentioned many points where uniformity already exists. If such is the case, the work of standardization is made all the easier, for all that is necessary is for your association to adopt them formally as your standard.

Proposed Standardization Well Received

Finally, I wish I could make you feel the enthusiasm with which this matter has been received by ALL the machine users with whom I have discussed it. From the viewpoints taken, it has been evident that the advantages of such uniformity will be felt not only in large manufacturing departments of machine shops, but likewise in the tool-making room and in the job shop. Its advantages in all three of these places have been emphasized to me. One superintendent said in substance, the tool room is the place where the greatest good from such uniformity will be felt, for there the work is special, there we feel the need of interchanging tools between machine and machine, and the equipment will be made truly elastic if details are standardized. A works manager said: "Our large manufacturing departments are the ones that will be benefited by the establishing of such uniformity," and the proprietor of a jobbing shop added: "Such standardization will save me money every day, besides permitting me to buy new machines of makes that I favor, but have not deemed it right to purchase in the past, because in many of the essentials they differed from the equipment already in use? Had I bought these machines, I would have had also to buy a special tool equipment to go with them." One enthusiast expressed himself by "me for it," while another man who had influenced the buying of $750,000 worth of machine tools during the past eight years, said: "Standardization of machine tools, as you have outlined it, is the greatest constructive step in machine-tool design that I can imagine."

15-16 INCH HIGH SPEED DRILL TEST.

We are in receipt of the following particulars of the test of a 15-16 inch high speed drill, through the courtesy of Alexander Gibb, 13 St. John Street, Montreal, Canadian representative of the drill makers, J. Beardshaw & Sons, Sheffield, England. The test was made on 25th August of this year, by the Sheffield Testing Works, Ltd., Blank St., Sheffield, England.

The drill, 15-16 inch diameter, is known as the "Conqueror" high speed, and showed an analysis in the steel bar of .44 carbon, .15 silicon, .34 sulphur, .031 phosphorus and .77 manganese. The revolutions per minute were 435, and the number of holes drilled 100. The depth of hole was 2 inches and, therefore, the total depth of hole cut was equal to 200 inches. The duration of test was 30 minutes, 46 seconds, the depth of hole per minute $6\frac{1}{2}$ inches, and the feed per revolution .015. The lubricant used was soapy water.

On conclusion of the test, the cutting edge of the drill was classed as being in good condition.

INDUSTRY'S TOLL OF DEATH.

Industrial accidents to 180 individual workpeople in Canada during the month of September, 1911, were reported to the Department of Labor. Of these 58 were fatal and 122 resulted in serious injuries. In addition, five fatal accidents were reported as having taken place prior to the beginning of the month, information not having been received by the department before September, 1911.

A Unique Census Counting and Tabulating Machine

By J. H. Williams*

A general description of an interesting and ingenious machine employed by the Canadian Government in compiling the recent Dominion census. It automatically tabulates all kinds of statistical information, and is the first of its kind ever built.

FOR tabulating the statistics obtained at the fifth Canadian census taken in June this year, the Dominion Government used the ingenious machine here described and illustrated. After a somewhat similar tabulator had proved its efficiency in handling the results of the last United States census, the designs for this present type machine were purchased by the Canadian Government from Chas. W. Spicer, the engineer, and tenders to supply three of them were thereafter invited. A high official from the Census Bureau at Ottawa, accompanied by Mr. Spicer, visited a number of machine shops in different Canadian cities to examine into their facilities for executing an order of this description. As a result of these visits, the contract was finally awarded to Jos. P. Cleal, mechanical expert, Toronto. Mr. Cleal is a well-known designer of cash registers and other intricate mechanisms, consequently his shop is well equipped for expeditiously turning out fine and accurate work.

The Census Cards.

The statistics are printed in contracted form on census cards, one of which is shown in Fig. 1. Each line of information is distant ¼ inch both horizontally and vertically from the next line. The cards, 6⅝ by 3¼ inches, have a uniform thickness of .006 inch. The reason for the right hand lower corner being cut off is to ensure their being all stacked right side up before being placed on the machine.

The cards are first perforated in a machine having a key board similar to a type-writer. One clerk reads out the information from the census papers sent in by the enumerators, while a second clerk punches the card to correspond. The card and the census paper are then turned over to two other clerks, one of whom reads out the information given on the card, while the other checks it by the paper; thus each card is checked twice. By means of the perforations in the cards, the tabulator is able to list the returns; the principle being analogous to that used in mechanical piano-players and similar instruments.

Operation of the Machine.

Fig. 2 gives a general side view of the machine, while Fig. 3 shows the front, where the card selecting is done. The small motor seen near the floor in Fig. 2, operates the machine, the cards passing through at the rate of 200 per minute. Referring to Fig. 3, the bar A, is electrically insulated from the frame of the machine, and as may be clearly seen in the cut, is notched to carry a number of brass fingers, six of which are seen in place. Each of these has a small pin running transversely through it near the front rounded shoulder, and each pin carries three fine springs of piano-wire twisted round itself, to make contact with the revolving cylinder below. The cards, after being perforated, are piled up on the platen or table B. They are compelled to pass into the machine square and true by suitable guides, which were removed for the purposes of these photographs. The rocker C, feeds the cards in at the rate of 200 per minute, a gate (not shown) preventing more than one card entering at a time. The cam, D, raises and lowers the vertical rod E, attached to which are a series of light metal chutes F. It will of course be understood that the cams, vertical rods and chutes are in pairs, one set on each side of the machine. The width of the chutes is slightly greater than the thickness of the card, and attached to each pair, there are two parallel wires about 6 inches apart, which terminate at one or other of the metal uprights seen in Fig. 2. These uprights form compartments into which the cards fall, after being conveyed along the wires by the fingers attached to the endless tapes seen in Fig. 3.

It must not be supposed that one passage through the machine suffices to tabulate all the information contained on each card. On the contrary, the card is passed through fourteen times, a different line of information being collected each time. When the cam D, is at the top of its stroke the edge of the card is always ¼ inch beyond the contact springs and exactly opposite the bottom

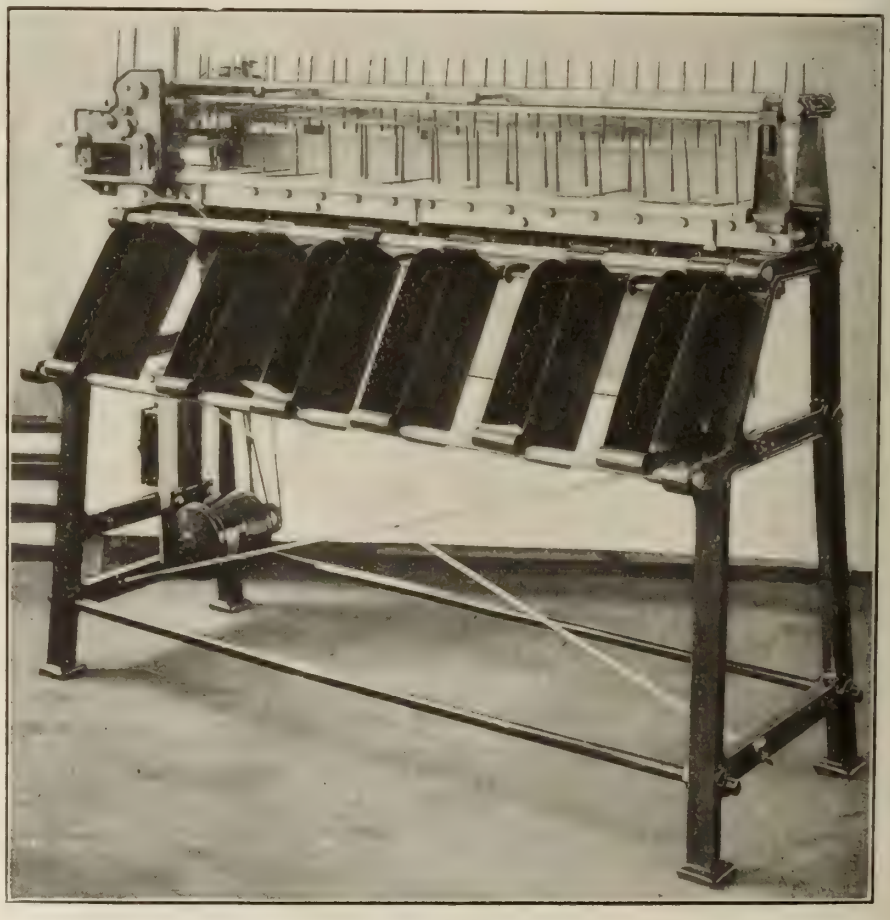

Fig. 2—Census tabulating machine.

Associate Editor, Toronto.

chute. For every ¼ inch of the card's advance, the cam lowers the rod E, a distance equal to one chute. The cam makes one complete revolution for each card that passes.

The Tabulation Process.

Suppose it is desired to tabulate the information contained in the ninth column from the right hand side of the cards. All the contact fingers, except ninth from the right are removed from the machine. The cards are then placed on the table B, and the machine started; the cards being fed in from the bottom of the pile. Any card, perforated to give the third item of information in the column, will have its perforation ¾ inch from the front edge. Let us follow the course of such card through the machine. It is fed in between the spring contacts and the cylinder below. When it has entered to the extent of ¼ inch, the vertical rod E, is at the top of its stroke and about to descend; the card then being opposite the bottom chute. When the card has advanced another ¼ inch it is opposite the second chute from the bottom, but with an advance to the third ¼ inch, the perforation in the card allows the piano-wire springs to make electrical contact with the cylinder below.

This operates a magnet which instantly throws two pawls into gear with two racks cut on the rod E. The latter is thereby prevented from falling further and remains in its then position while while the card enters its chute. The fingers on the endless belts now push the card out of the chute and convey it along the two parallel wires. On reaching the end of the latter, the card falls over into its compartment, and is at the same time recorded by an electrical counter not shown. An attendant removes the cards from the compartments from time to time, the metal boxes seen in Fig. 2, being provided for this purpose. As soon as the card has left the chute the contact timers, seen at G in Fig. 3, render the magnet inoperative, and the rod E, is again picked up by the cam in the course of the latter's revolution.

As the cards are only .006 inch thick, it will be seen that great accuracy was required in making the cams, chutes, and machine generally. With the exception of the electrical equipment, the whole of the work, including the nickel plating and the enamelling of the frame was carried out in Mr. Cleal's shop, under the superintendence of his mechanical engineer, Mr. R. A. Schrag.

Machines of this type are well adapted for the use of banks and insurance companies. The three in question on completion of the census returns, will be employed in the statistical work of the Department of Agriculture, Ottawa.

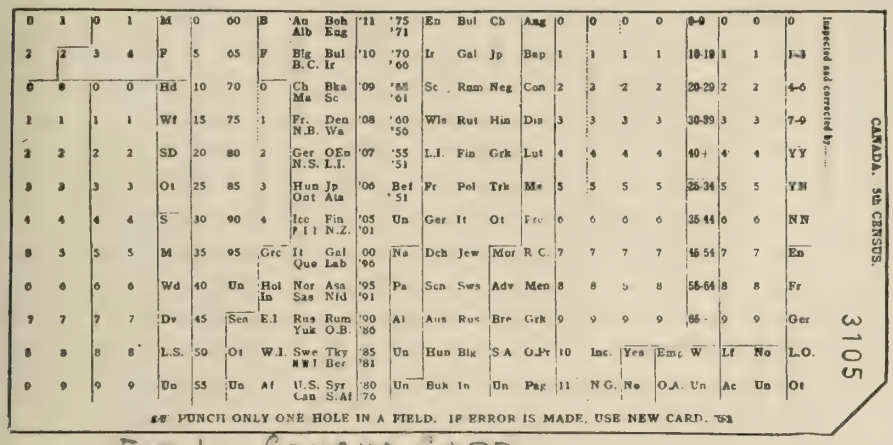

FIG 1. CENSUS CARD

INTERNAL GEAR DRIVES.

The advantage of gears over chains, as a motor-truck drive, may be enumerated as follows: The gears can be properly inclosed and lubricated, and any range of reduction obtained. The differential can be run at a higher speed and hence at less strain and higher efficiency than chains. The bevel gear reduction can be made one to two, while with the chain, the bevel reduction is found to be in general one to three, and one to four. The former, therefore, is a more efficient bevel gear because the efficiency of the bevel gear decreases when the ratio of reduction increases. The side swaying of car causes chains to get out of line, thus increasing wear. The stretch of the chain must be taken care of from time to time by readjustment of the radius rods. Both radius rods must be given uniform readjustment, or the rear wheels will not run in line. Few laymen can do this. Bevel gears are at all times in positive relation to one another and do not require readjustment.

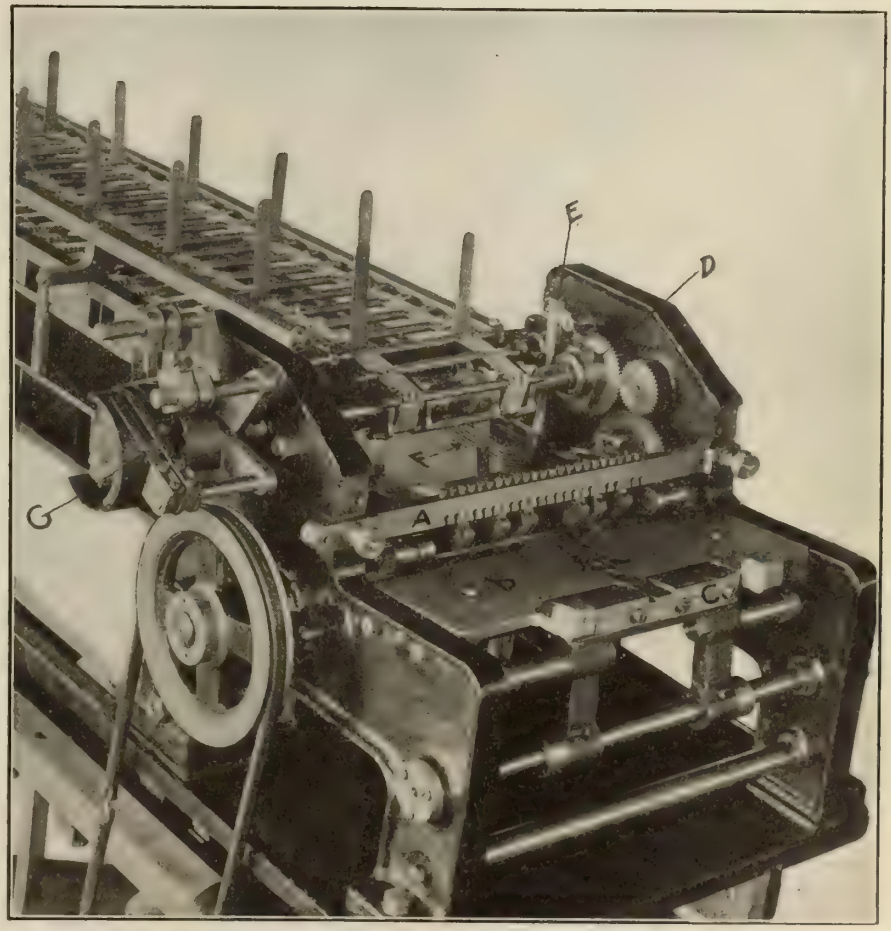

Fig. 3—Census tabulating machine.

Mechanical Drawing and Sketching for Machinists*

By B. P.

A Series of Progressive Lessons Designed to Familiarize Mechanics With the Use of the Apparatus Necessary to Make Simple Drawings, to Encourage them to Realize How Important a Factor it is of Their Equipment, as Well as Being a Profitable Pastime.

BEFORE leaving the subject of screw threads, let us briefly explain the principle of multiple threads and the method of drawing them.

As previously mentioned, the friction of an angular thread is very high, therefore, large screws are generally made with square threads so as to overcome this trouble. When of coarse pitch, however, square-threaded screws are somewhat weak, since the great depth of the thread reduces the body diameter considerably. For example, let us consider the case of a square threaded screw, 4 inches in diameter and 2 inches

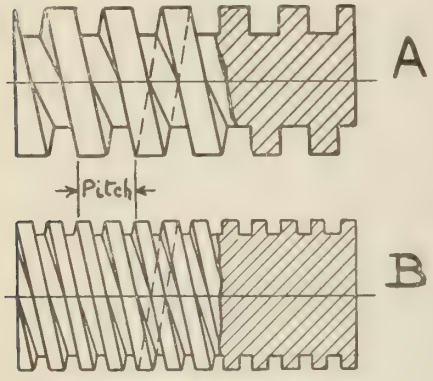

Fig. 1 –Drawing and sketching.

pitch. Since the depth of the thread is equal to half the pitch, the diameter of the body will be only 2 inches, if we make the screw single threaded. By dividing the pitch into two threads parallel to one another, the diameter of the body will be increased, for the pitch (2 inches) will now contain two threads and two spaces, instead of one as in the single example. Also, each thread will be $\frac{1}{2}$ inch wide and $\frac{1}{2}$ inch deep, leaving a body diameter of 3 instead of 2 inches.

Fig. 1 shows the difference between a single and double-threaded screw of the same pitch, the former being shown at A and the latter at B. The pitch may be divided into any number of threads desired; thus, we may have a three or four-threaded screw. Care must be taken not to confuse a four-threaded screw with a screw having 4 threads per inch.

In drawing multiple threaded screws, remember that with the number of threads even, the threads at the top are opposite those at the bottom; and if the number is odd, then the threads at the top are opposite the spaces at the bottom.

Fig. 1 also serves to show the method usually adopted for showing square threads. It will be noted that the threads at top and bottom are joined up by straight lines instead of by helical curves as described in last lesson. The latter method is the correct one, but takes a long time, and is seldom employed except when drawing large screws full size or to a fairly large scale.

Fig. 2 is introduced merely to show the difference in appearance between a right hand thread C and a left hand thread D. For the sake of first year apprentices, it may be as well to explain that a right hand screw is one which revolves when advancing into its nut, in the same direction as the hands of a clock, while a left hand screw revolves in the opposite direction. Thus in Fig. 2, C and D both have the same pitch, but revolve in opposite directions when entering the nut.

For ordinary shop drawings or sketches it is usual to indicate a screw thread by a series of parallel lines as may be seen in Fig. 3. This shows a $\frac{3}{4}$ inch bolt, $1\frac{5}{8}$ inches long. The length of a bolt is always given from the underside of the head to the end as here

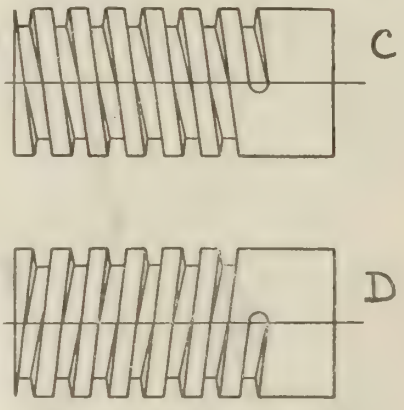

Fig. 2 Drawing and sketching.

shown. The only exception to this rule is in the case of bolts or screws having countersunk heads, where the overall length is usually given. In Fig. 3 it will be noticed that the dimensions of the head are not given, because they are standard.

How to Draw an Eccentric.

Fig. 4 shows an eccentric suitable for a locomotive or small marine engine. To allow the eccentric to be placed in position on the shaft or axle it is split across, the two parts being fastened together by two bolts and cotters. The eccentric is keyed upon the shaft and further secured by two set screws fitted with lock nuts. The screws are cupped or hollowed at the points and hardened, so that they will secure a good grip on the shaft. This sketch has been purposely left incomplete, especially in the plan view, which is supposed to be in section. In drawing the two set screws, care must be taken not to make them

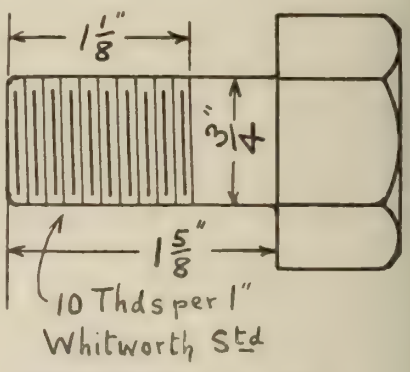

Fig. 3—Drawing and sketching.

so long that they will not go into place. It will be found necessary for this reason to reduce the thickness of the locknut and bolt head to about $\frac{5}{8}$ inch. Except for the length of these bolts all necessary dimensions have been given and the student should have no difficulty in completing the drawing. A scale of 2 inches to the foot will be suitable, or it may be made larger, if desired. First lay down the horizontal centre line of the elevation view. Across this, draw a short vertical line. The point of intersection of these will be the centre of the shaft, which is 7 inches diameter. Three inches to the right of this point draw another vertical line, whose point of intersection with the horizontal centre line will give the centre of the eccentric. It will now be seen that a complete revolution of this eccentric will move the valve 6 inches. The two halves are "dove-tailed" together, the joint being $\frac{3}{8}$ inch deep, which prevents side motion and takes all shear off the bolts. A similar projection, all round the outside of the eccentric, fits into a like recess in the eccentric strap and keeps the latter in place.

*Ninth of a series of an Instruction Course.

Sketching in the Shops.

The student will find it instructive to get around the shop at noon hour, with his rule and calipers. He should practice making free hand sketches of simple parts of machines or engines, taking care to put down all necessary dimensions, and in his spare evenings make proper finished drawings from them. One or two attempts at work of this kind will do more to teach him how to make shop sketches of practical value than many columns of print. Start with easy subjects such as plain pistons, cast iron pipe, etc, and gradually work up to higher things. It does not matter how rough the hand sketch provided all necessary dimensions are given, from which to make a finished drawing.

The student will be surprised at first to find how many needful points or figures he has omitted, and pains must be taken to quickly correct this fault. The ability to be able to make correct and intelligible sketches is a distinct asset to any mechanic, and it needs only a little practice to enable the beginner to see almost at a glance what dimensions are lacking from his sketch.

Exercises.

1.—Draw to any convenient scale a single-threaded screw 2 inches dia. by $\frac{3}{4}$ inch pitch. The thread to be square section and right handed.

2.—Draw a left-handed screw of the same dimensions as the above, but double threaded.

3.—Draw a hollow cast iron piston 12 inches diameter by $4\frac{1}{2}$ inches wide, with core 9 inches diameter by 3 inches thick. The hole for piston rod is 2 inches diameter. Round the circumference of the piston are two grooves for the packing rings. The grooves are $\frac{3}{4}$ inch wide by $\frac{1}{2}$ inch deep and the centre of each groove is $1\frac{1}{4}$ inches from the vertical centre line of the piston.

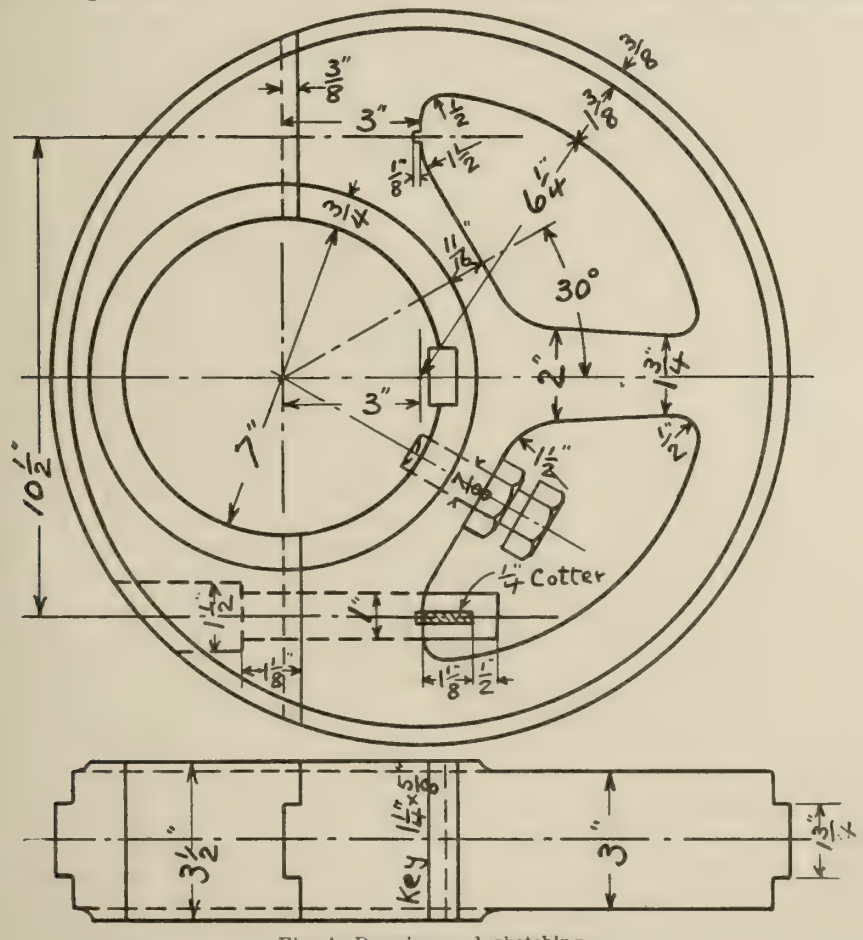

Fig. 4—Drawing and sketching.

A LARGE LATHE.

One of the most powerful lathes ever constructed was recently put into service by the Darlington Forge Co., England. Its massive double-slide bed, 61ft. 6in. long, 16ft. wide, and 27in. deep, is built up in two lengths jointed down the centre with five longitudinal and several transverse box girders, and is so arranged that an additional length can be easily added later.

The lathe, which was built by Messrs. Hulse and Co., of Salford, England, will admit work 40ft. 6in. long and 13ft. 4in. diameter between centres. The fast head stock has two changes of double and two of quadruple machine-cut forged steel gearing, the changes being readily effected by means of racks and pinions. The spindle is 19in. diameter by 27in. length in the front bearing, and 15in. diameter by $22\frac{1}{2}$in. in the back bearing, A large ball bearing is fitted to take the end thrust. The machine is driven direct through machine-cut double helical forged steel gearing by a 100 b. h.p. motor, having a speed variation of 3 to 1, mounted on the foundation plate at the front of the headstock. The keys on the shafts in the fast headstock are forged solid with the shaft, and all the sliding wheels are fitted with two keys. The face plate chuck is 12ft. diameter, cast in one piece, bolted to a large collar forged on the spindle nose. The movable headstock has a forged steel spindle 12in. diameter. Four independent sliding carriages are provided, two at the front and two at the back, with transverse slide and extra holding-down strip. Each is fitted with a rotating nut and reversing gear, swing frame and machine-cut steel change wheels, these latter not only imparting the various rates of feed longitudinally for sliding or screw-cutting, but traversely for surfacing. Rotary motion is transmitted by means of longitudinal shafts driven from one of the quick-running shafts on the fast headstock through two changes of spur gearing; means of hand adjustment being also provided. The sliding carriages have a quick traverse motion in both directions driven direct from a 20 b.h.p. constant-speed motor self-contained with the lathe. The range of spindle speeds is from 0.4 to 30 r.p.m.

THE JANNEY UNIVERSAL VARIABLE TRANSMISSION DEVICE.

Lecturing before the Canadian Society of Civil Engineers, Montreal, Mr. Newman, chief engineer of the Universal Transmission Co., described the construction of the Janney Universal Variable Transmission Device. The paper was chiefly of a technical character, and was illustrated by lantern slides and a working model. Mr. Newman stated that the device, which has been adopted by several governments for operating guns on turrets, was applicable to cranes, automobiles, cars, vessels, locomotives, elevators, and numerous other machines, and he claimed that it was more efficient, and in the end, more economical, than other transmission devices. During the discussion, approval of the idea was expressed, but it was suggested that more experience was necessary before its application could be made commercially possible.

Mr. Moscrop, of the Campbell Gas Engine Co., Halifax, England, who has been looking over the Canadian field for the past three months, returned to England last week. While in Canada Mr. Moscrop appointed agents at Vancouver, Winnipeg and Toronto.

SYSTEMATIC BUSINESS MANAGEMENT

Practical Articles for Managers, Superintendents, and Foremen, to Assist in Carrying on the Business Economically and Efficiently.

A PHASE OF EFFICIENCY MOVEMENT.

By Observer, Winnipeg.

ONE cannot help remarking that the movement toward higher efficiency is in its essence and entirety a challenge to labor. It is quite obvious that labor (organized or otherwise) had no part in the birth of any system which guaranteed increased renumeration for more efficient performance. Is it a matter of surprise then, that the ideas and efforts of capital, to induce labor to accept its propoganda, should be treated with some suspicion? Each side has always been prone to discern in the other's best intentioned overtures a motive at least selfish, if not actually hurtful. Industrial development and progress has accentuated rather than mitigated this distrust, until to-day we find the two sections, like Britain and Germany, armed to the teeth alike for offence and defence, and each largely defiant.

I cannot help believing that both capital and labor have much ground for grievance against one another, although I should not venture to express an opinion as to which carries the largest burden in that respect, but I do say that labor has suffered and is suffering most, by its own doings or otherwise in some degree.

Labor Conditions in England.

Speaking recently in Birmingham, England, Bishop Gore, a man of broad views and wide sympathies, said:—"There is a profound sense of unrest and dissatisfaction among the workers. Recently society has been deeply alarmed at its symptoms. I cannot but believe that this profound discontent is justified, though some particular exhibitions of it are not. The longer I have lived in this great industrial centre, the more I have felt that, as Christians, we are not justified in tolerating the conditions of life and labor under which a vast mass of our population is living. We have no right to say that these conditions are not remediable, and we have no right to expect that they will be remedied until Christian hearts and Christian heads energetically demand and insist that they shall be altered."

A well-known newspaper commenting on the foregoing, says:—"No one who has seriously considered the facts and figures can doubt that the bishop is right, and that the working classes are right in asking more and more persistently, whether their share of the products of labor and capital is adequate. There is no reason to be afraid of this discontent of the people, because it is something more hopeful for them than a listless tolerance of their present intolerable conditions."

Labor Conditions Anywhere.

What is true of England is just as true of any country, and be assured no system of scientific management backed up by the "twelve principles of efficiency" will effect the desired remedy. It is much like the methods adopted by churches, young men's Christian associations in reformation work. They wall-in the renegade by precept and regulation to such an extent that he can only exist by propping-up, which, if withdrawn, leaves him more helpless than he was originally and probably worse off. The factory operator who is systematised sinks his initiative and individuality to become an automation, and will probably find when it is too late that there are different degrees of its efficiency, as well as that of men.

If capital or employers would ponder the question for a moment, and realize clearly that accident of birth, opportunity, circumstance and bank balance are after all the main distinctions between them and their employes, and that each man of the latter has a limit of endurance under conditions more or less exacting, there would be fewer whisperings of the octopus tyranny of the former and dastardly tactics of the latter. There are good and bad in each class, which of itself is of course not very comforting, but is it too much to ask of the former, that they influence their fellows, and so bring about a higher sense of duty and of such reciprocial nature, that there will neither be the extreme of loafing on the one hand nor slave driving on the other.

Be sure that the race suicide, which would make a man into a machine wound up at 7 a.m. and 1 p.m., and guaranteed to deliver a definite output each 5 hours, will meet with a more strenuous opposition than that other and perhaps resultant feature with which we have now become so familiar.

MODERN MANAGEMENT NOTES.

WASHINGTON, D.C., Oct. 10, 1911. —The House Committee on Labor recommends that at the regular session of Congress beginning in December the so-called 'Taylor system, and similar systems of shop management be investigated, in order that "whatever may be good in any of them may be approved and applied, and whatever there may be bad may be condemned and eliminated."

Secretary Meyer has appointed a board of naval officers, headed by Rear Admiral Vreeland, to prepare the necessary instructions for putting "modern management methods" into the navy yards. The board will try to determine how to utilize the personnel of ships in making repairs at yards. It will try to decided to what extent naval officers should be trained in the shops; also what proportion of the two years' cruise of midshipmen should be spent in practical work at navy yards. In short, Mr. Meyer will try to systematize operations of the navy yards in such a way as to bring them more in harmony with the most efficient methods of the highest class civil establishments.

STEEL PRICES AND WAGES.

"The possibility of lower wages in the steel and iron trade is being seriously discussed," says the Iron Age, adding: "In the opinion of some manufacturers it is inevitable that labor will share the hardships which the trade is undergoing."

In 1898 nearly all steel and iron products sold at the lowest prices ever known in this country. Partly to remedy that distressful condition the big steel combinations were formed, culminating three years later in the Billion-Dollar Steel Trust. Also, ownership of the best ore and coke supplies were gathered into a few hands. Now the price of sheet steel is as low as in 1898. The labor cost, according to the Age, is two dollars a ton less; but the bars from which it is made are five dollars a ton higher, and "it is hard to see how independent mills are living. . . . . Nor is there any living profit for a wire mill buying its rods at twenty-six dollars and selling plain wire at a cent and forty-five hundredths a pound."

The Trust, of course, doesn't have to buy rods at twenty-six dollars or bars at twenty-one. It makes both out of its own iron ore and coke; and it is not within the power of all the attorney-generals in Christendom to disperse the ownership of the ore and coke as it was in the nineties. The cuts fall hardest upon certain independent makers of finished products, who may have to call upon labor to "share their hardships" as though labor didn't have enough hardships of its own which nobody shares, and though the labor cost, as to sheet steel at least, is two dollars a ton less than in 1898.

That is what free competition usually gets round to—a reduction of wages and then a bigger combination. It is very well known that a great number of steel and iron workers now make barely a living wage, though they perform twelve hours of gruelling labor daily.—Ex.

Shop Floors *

(By Leonard C. Watson.)**

NO floor surface is perfect from every point of view. The question of what floor to adopt for a shop is therefore always a choice between different combinations of good and less good qualities. While the factor of cost is apt to be considered the dominating one, there are many situations in which cheapness is not the most important item in the choice of a floor; or to put the matter a little differently, it is sometimes economy to discard the floor that is cheapest in first cost for a different floor of higher cost and which will justify its higher cost because of its better adaptation to the particular kind of service required of it. Therefore, althongh I have been asked to speak particularly about granolithic floor surfaces for shops, I am not in the attitude of advising a granolithic floor for any and every service under any and all conditions. The granolithic surface has good qualities of great importance and I shall give these qualities due weight; but I shall also point out some of the circumstances under which it may be better in particular cases to use wood floors.

Considerations Affecting Choice.

In first cost, the granolithic floor surface has the advantage over a wood floor; the cost of such a surface laid in the best manner being about equal to the cost of seven-eighths maple flooring delivered at the work. Besides this advantage in cost, the granolithic surface is fire-proof as well as waterproof, and will not decay or disintegrate under washing with water, which latter is one of the weak points of the wood floor.

There are other considerations involved in a decision between granolithic and wood floors, concerning which it is unsafe to be very dogmatic without first defining very precisely the conditions of each particular case. Taking first, such a matter as the wear of these two types of floors, it is easy to see that a wood floor is more easily repaired than a granolithic surface, and that repairs to a wood floor can bring it to the original maximum efficiency. A granolithic surface can also be repaired, so that the new patches will be quite as good as the original surface, but the time and care required is much greater than with a wood floor. In repairing a granolithic surface, it is necessary for best results to cut out the broken or defective portion down to the slab, leaving the cut with vertical edges. Next, the slab must be cut with a sand blast or acid until the aggregate stands out sufficiently to give a good bond for the new surface. Then the slab and edges of the cut, having first been well wetted, must be grouted with neat cement mortar, on which the new finish is laid before the grout has set. Finally, the patch must be kept wet, and protected from use for at least a week. Being rarely possible to satisfy all these necessary conditions, it is therefore true in average practice that repaired portions of granolithic floors are inferior to the original surface in wearing quality.

Workmanship a Factor in Comparisons.

In this contrast between the wood and granolithic floors we have to deal with the question of workmanship. With a maple top floor, the difference in wearing quality between a floor laid by a first class carpenter and the floor laid by a merely average carpenter, is comparatively slight; but with the granolithic finish, ignorant or hasty work is disastrous almost from the outset. The granolithic finish, to give good service, must be laid according to right theory, and every step in the workmanship must be first class. It is not at all difficult to get a first class granolithic surface if one starts out with a determination to have it. Good works costs very little more than poor work. It must be admitted, however, that a great many granolithic floors have been unsatisfactory. Poor workmanship and wrongly chosen materials are the reasons.

Granolithic Surface Operatives' Health.

Among objections which have been raised to the granolithic surface, one of the most prominent is the bad effect of the concrete floor upon the health and comfort of the operatives who stand upon it. There seems to be little doubt that long standing in one position on a concrete floor is not good for the operative. The reason, for such ill-effects as occur, is not the excessive hardness of the concrete floor, as generally supposed, but its great heat absorbing power. Wood is a poor conductor, a poor radiator, and therefore in general a pretty effective insulator; but when an operative stands for hours on a concrete floor, the heat of his body is conducted from his boot soles into the concrete rather rapidly. In consequence of this drawing away of the body heat, feet and legs become more or less chilled, the circulation in the legs is slackened, and pressure on the skin of the feet, coupled with this sluggishness of circulation, due to the loss of heat, may easily give rise to sore feet and to various pains which are commonly classed under the head of "rheumatism."

That these bad effects do occur, has conclusively appeared in investigation of the whole question made by the Aberthaw Construction Company about a year ago. For operatives who are moving about while at their work, or who wear thick-soled boots, this excessive extraction of the body heat by the concrete floor is a negligible matter, but for men working steadily at machines in one position, some insulation is required. It is the practice in many machine shops to give the men footboards or gratings of wood on which to stand. These do away altogether with any ill-effects from the concrete floor.

Durability of Granolithic Floors.

Granolithic floors have been attacked as not sufficiently durable under the rough usuage of the machine shops and foundries. Here, again, we have to take into consideration the all important item of materials, workmanship, and theory of construction. Nothing but the hardest natural stone in the way of a masonry floor can long withstand the wear of heavy trucking. The usual form of truck is provided with small diameter wheels having a flat tread and sharp edges, and such wheels, with the tilting or slewing of trucks, always in evidence in turning corners, will gouge and dig into any kind of floor. The granolithic finish can, however, be made with such a high percentage of tough elastic aggregate, that the wear of trucking is borne almost exclusively by the aggregate itself. Nothing but steel and granite can outwear such a floor. It is the part of wisdom, in laying granolithic floors over which there is heavy truck traffic along certain lines, to provide steel plates or gratings properly set in the concrete to form lanes or tracks for heavy trucks.

---

*Paper read at the New York October meeting of the A.S.M.E.

**President, The Aberthaw Construction Co., Boston.

Tools, Processes and Products as Floor Factors.

The nature of the tools, processes and products in a given shop bear on the decision between granolithic and wood floors. An edged tool dropped edge down on a granolithic floor would be damaged by the impact, while the same toql dropped edge down on a wood floor would dig into the wood and probably suffer no damage. Also, a manufactured product consisting of delicate metal pieces would be much more damaged by falling on a cement floor than on a wood floor. Still further, the dust produced by the wear of some granolithic surfaces has proved harmful to delicate machinery in some shops. The wood floor does not of itself produce a dust capable of any visible action as an abrasive. It is possible, however, by glueing battleship linoleum to a concrete floor to get many of the advantages of a wood surface. Tools and small manufactured articles are as little likely to break by falling on a linoleum surface as upon wood. The linoleum is without the innumerable cracks of the wood floor and therefore is much more easily kept perfectly free from dust. Linoleum is also an efficient insulation against loss of body heat to the concrete floor.

High resistance to wear of every sort and practically complete dustlessness, that is to say, freedom from the production of abrasive dust, can be secured in a granolithic surface properly made. It is always better that a granolithic finish should be laid on the floor slab while the latter is still green. A better bond between the finish and the slab can be obtained in this way than is possible after the slab has fully set. Unfortunately, the conditions governing the erection of concrete buildings usually put off the laying of the floor finish until all the rest of the building is practically completed, and this involves the need of using great care in cleaning and roughening the slab surface, so that the granolithic finish laid upon it will get the best possible bond with the slab. Ordinarily, the finish need not be more than three-quarters of an inch thick. Both for wearing capacity and for the avoidance of dust through abrasion of the concrete, the granolithic finish should contain the highest possible proportion of tough stone aggregate.

Constituents for Durability and Dustlessness.

For the most durable and most nearly dustless floor, my rule is this: First, it is better to use no sand; sand grains are brittle, are early broken by the abrasion of feet, and cause dustiness. Use for an aggregate, a stone suitable for macadam road, taking the sizes that pass through a half-inch round mesh screen, and nothing smaller than that passed by a 20 mesh screen. Mix the concrete dry, of a consistency used in making blocks, so that considerable tamping will be required to bring to the surface enough water for trowelling. Finally, do the trowelling before the mortar sets.

It is practicable in this way to get a surface that is 90 per cent. hard stone. The mortar, of course, wears more quickly, but its small area makes the results of this wear unobjectionable. Prolonged trowelling of a wet mixture brings to the top the "laitance" of the concrete, which is the part incapable of a true set. A top layer of "laitance" is therefore porous and wears down quickly. Even fine particles of good cement should not be brought to the top, for they form a layer which is weakly bonded to the rest of the concrete, which wears away quickly, and appear in the air as dust.

The Joliette Steel and Iron Foundry Co., Ltd., Joliette, P.Q.

By L. G. Dennison, B.A., B.Sc.

Being a brief outline description of the Dominion's latest steel foundry enterprise, and which has proven by operation and output to be able to cater to and command a steady and important machinery manufacturers' connection.

THE progress of Canada's development is daily indicated fully and clearly by the addition of new plants to cope with the increasing demand for new or larger quantity industrial products. The Joliette Steel & Iron Foundry Co., Joliette, P.Q., have recently introduced themselves to purchasers of steel castings, and as showing their entry into this domain to have been warranted, and their ability to deliver both quantity and quality output, projected extensions are already on the tapis to meet insistent demand. Iron foundry products as well as those from the steel foundry form a large part of the firm's business. Each is, however, distinct from the other, and only that referring to the steel section will be dealt with in this paper.

The buildings occupy a ground area 90 by 120 feet, to which a length addition of 50 feet is immediately contemplated. The power house is located at the rear of the right wing.

Foundry Equipment.

The main molding floor is served by a 45-foot span crane of 30,000 pounds capacity, manufactured and installed by the company, and operated by three Westinghouse D.C. motors of 5, 7 and 10 h.p. respectively. The cupola and converters are placed at the rear end of the foundry, the two latter being set low, and with the ground dug out in front for ladle filling convenience. The cupola is set on the first platform and

Joliette Steel & Iron Foundry, Ltd.—Main W orks Building.

* Associate editor, Montreal.

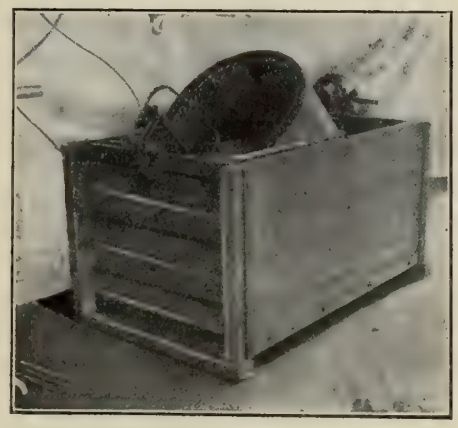
charged from the second, to which the charging material is carried by an elevator. The port of the cupola is about 7 feet from the edge of the platform, and discharges into a trough about 7½ feet long with a hole in the bottom just beyond the platform edge. This in turn discharges into a trough exactly similar to the other except that it is capable of swinging, so as to pour into the converter or ladles placed within its 7 feet radius.

Joliette Steel & Iron Foundry, Ltd.—Foundry Interior.

The Joliette Steel & Iron Foundry, Ltd.—Steel Y-Pipe Casting.

Ten, five, three and one-ton ladles, together with the usual smaller units form an equipment both serviceable and highly satisfactory. A full and varied assortment of molding boxes of latest pattern lends facilities for overtaking work of much variety of size and form.

The drying ovens 11 by 15 by 8 feet high are provided with convenient shelves and truck tracks reaching out into the shop for crane loading or unloading purposes.



Power Equipment.

Power is obtained from S. Vessorts' hydro station on the river, and the main drive is from a 40 h.p., d.c. motor. A shunt wound dynamo supplies current of 220 volts to the overhead crane, and a 115 volt, 130 ampere machine takes care of the welding section. Compressed air is of course largely used throughout the plant for the operation of labor saving tools, etc. Altogether, this plant has the nucleus of great possibilities, and we believe that at no very distant date, increased success and growth will be the portion of its promoters.

MECHANICAL PLATING BARREL.

A new mechanical plating barrel has been invented and patented by G. L. Wallace of the Harshaw, Fuller & Goodwin Co., New York, who are placing it upon the market. As will be seen from the illustration the barrel is a combination of the horizontal and oblique types of plating machines, the advantages of both being obtained. Thus the large quantity of solution used in the horizontal type is combined with the convenience of the oblique barrel as regards inspection and removal of the work. The barrel bottom is perforated and covered with cocoanut matting; this having been proved durable and satisfactory for the purpose. Two inclined rolls in the bottom of the tank support the barrel, which is driven by a spur gear at the end.

Inside and out side anodes are used, and the inside anode, located directly over the work, is so fastened that it can be swung out of the way when the barrel is removed. The cathode connection is hinged for the same reason.

Mechanical Plating Barrel.

The barrel is 30 inches diameter by 30 inches deep and is probably the largest made.

STRENGTH OF CAST IRON.

By. C. T. R.

A LARGE volume of data has been presented by various observers, dealing with the influence of the well-known metalloids upon the strength of cast iron. Silicon, sulphur, phosphorus, manganese and carbon combined and graphic, have all been shown to produce effects more or less pronounced, and close attention to these elements is a matter of importance to every foundryman operating along modern lines. It is now one of the first essentials in foundry practice to become familiar with these ingredients of cast iron, and to maintain a vigilant care that their percentages remain within limits that are best suited to the type of work that is being made. By so doing, a very large proportion of foundry troubles can be avoided, and with the knowledge thus afforded, it is possible to locate, readily, casting difficulties that may arise.

It is not the intention at present, to deal with this branch of the subject, but rather to direct attention to the fact that even when the composition of iron in relation to the common metalloids is maintained at a standard, the strength of the metal as shown by test bars may vary widely. The writer has met with cases in which for a period of some weeks, the transverse strength, of one inch square bars broken on twelve inch centres, has run 200 to 300 pounds lower than the standard strength for the foundry in question, falling, let us say, from an average of 3,000 pounds to an average of 2,700 pounds.

Variation in Transverse Strength.

The causes of these conditions are far from being as well understood as we could wish, but they are generally traceable to melting conditions, either in the foundry or in the blast furnaces, where the pig iron has been produced. It has become more common to meet with references to oxidized metal during recent years, although the nature of the oxidization is not very clear. The numerous alloys on the market, as correctives of this oxidization, find their sale largely through a reality of the condition. It seems strange that oxidation of a metal containing considerable percentages of silicon and carbon should

occur, and until the subject is made clearer, it is not well to place too much emphasis upon the descriptive term "oxidized," although the term serves to describe a condition, and in the meantime may be accepted. The foundryman who is responsible for the evils due to faulty cupola practice, should make sure that the conditions of melting that he is following are correct. He should take particular care that the coke bed is maintained at the

Fig 1.—Microphotograph of Coarse Bronze Powder.

correct height, for if it falls too low, oxidized metal will probably be the result; while if it rises too high, not only will fuel be wasted, but it is believed that the the condition of the carbon in the iron may be so modified as to yield a weaker casting. In relation to blast, there has of late been a growing conviction that high pressure, once quite popular with some melters, is a mistake, and that the most desirable condition provides for an ample volume of air at very moderate pressure. Charging should be uniform and level, while quantities of scrap, either excessively rusted, or otherwise undesirable, should be avoided.

Melting Conditions at Blast Furnaces.

When all has been done by the foundryman, under conditions which are standard, and every precaution has been taken to ensure good results, the fact remains that melting conditions at the blast furnace may produce a pig iron with the correct percentages of metalloids indeed, but yet unsuitable for producing the best casting, especially with relation to strength. This is a matter calling for the attention of the furnace manager. The nature of the ore smelted, particularly in regard to the ease with which it is reduced, seems to enter into the problem, and it is known that furnaces using a large percentage of mill cinder, which is not easily reduced, do not produce the most desirable grades of pig, from the standpoint of the foundryman in search of strong castings.

We do not wish to place too much emphasis upon this phase of the subject, as the furnace is too frequently blamed for the faults of the foundry, but we believe, nevertheless, that there remains a field for investigation in regard to the influence of the ore upon the grade of the resulting pig iron. The subject is still in the controversial stage, and there are those who maintain that the furnace burden does not enter into the matter, except in so far as it influences the percentage of the well recognized metalloids. It has come under the observation of the writer that irons from the same furnaces, and of practically the same analysis have given widely different strengths under standard cupola practice in more than one foundry. At the same time, and under these conditions, it seems most reasonable to assume that the cause lies in the general conditions prevailing at the blast furnace.

BRONZE POWDERS AND BRONZING.

A Commission recently appointed by the British Government to inquire into the condition of the bronze powder and bronzing industry in England with reference to the health of the employes, have rendered their report.

They say, in their report, that bronze powders are made mainly in Nuremberg, Furth, and neighboring towns in Bavaria. They are not made in England and consequently they were not able to see the process of manufacture. They state as follows: "We are informed that the powder is produced from thin sheets of metal leaf by rubbing them through the meshes of fine wire sieves, and that the waste from metal leaf (Dutch metal) factories, in addition to new metal, is used for this purpose. After the addition of oil, the mixture is ground in suitable machines to the requisite degree of fineness; the greater part of the oil is then extracted by placing the mass in water and then subjecting it to strong pressure."

Several analyses of bronze powders were made in the Government laboratory and the following results were obtained.

The green, pink, violet and other colored powders are the regular bronze powders colored with analine dyes. The largest consumers of bronze powders are the lithographers.

The investigation indicated that bronzing machines are now supplanting hand bronzing, with the accompanying safety of the operatives. Bronze powder inhaled does not have the bad effect of emery or steel dust from grinding operations and is not apt to bring on pulmonary troubles like them. The dust is not sharp as they are, and does not penetrate the muscles of the throat. The effect of bronze powders is more of copper poisoning than that of dust.—Brass World.

AVOID BEING A QUITTER.

"The man who tries and fails, may oftentimes be excused, because of his attempting that for which he was not prepared, but oftentimes the unprepared

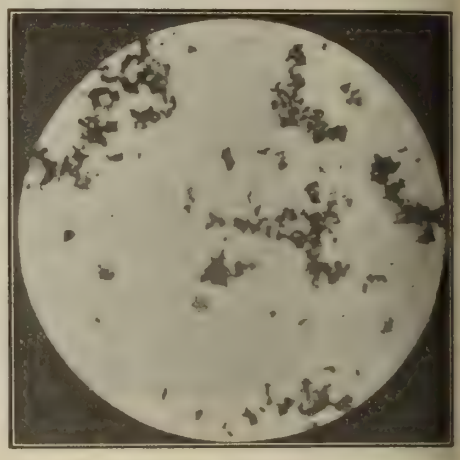


Fig. 2.—Microphotograph of Fine Bronze Powder.

man gives up when failure seems to be hanging over his head—he is a quitter and is shunned by his fellow men—it's hard to respect the man who has lost faith in himself, and it's few who do respect him. Oftentimes a few encouraging words from a close friend prevents a man from letting go his hold on this life. If we could but know when a man is ready to quit, a great many, so-called, failures would not be—but the line between success and failure is so fine that at certain times one never knows upon which side his shadow falls. Failure which comes from giving up hope, is merely the evidence of manhood which is lacking. Manliness is one of the most respected virtues which we may possess; it will with the help of health and industry bring that prosperity which so many men desire; so create it, cultivate it, should it not be inborn, and thus prepare thyself against those things which make out of man—a quitter."

The effect of vacuum upon the steam consumption of a turbine is strikingly shown by the reports of a recent test on a one thousand-killowatt machine in which the consumption increased forty per cent. with a decrease in vacuum from twenty-nine to twenty-one inches.

It's rash to wish all the fools were dead. Some of our best friends would be missing and lots of us who remained would have to move down several notches in the scale of merit.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

Moose Jaw, Sask.—The Saskatchewan Bridge and Iron Co., capitalized at $250,000, have decided to establish here. They will manufacture bridge and structural iron work on a large scale, including machine building, boiler making and repairing, iron and brass founding. The main building of the new plant is to be 200x90 feet. Excavation will probably be completed this fall and the building will be proceeded with in the early spring.

Calgary, Alta.—At the annual meeting of the C.P.R. held recently in Montreal, it was decided to award the new Western shops to Calgary. Nothing definite as yet can be learned about the size of the buildings or the estimated cost. In addition to repairing the rolling stock, cars for the system in Western Canada will be built here.

New Westminster, B.C.—The Hamilton Steel Works, of Hamilton, Ont., have secured a splendid site here on the waterfront at a cost of $700,000 and will proceed to erect a plant.

Ingersoll, Ont.—The John Morrow Screw, Ltd., will still further increase their plant here during the present year. They will erect a $15,000 building for the manufacture of twist drills.

Medicine Hat, Alta.—W. R. Martin and others are establishing an industry here to manufacture gas drilling tools.

Smith's Falls, Ont.—An addition is being made to the foundry of Frost & Wood at a cost of $25,000.

Amherst, N.S.—The new car shops in place of those which were burned out some months ago, are rapidly nearing completion. A new varnish shop 160x50 feet and a large extension to the passenger shed, 200x160 feet is also under construction. An order for 1500 box cars and eight snow plows has been received from the C.N.R. and another order has lately been placed for thirty gypsum cars for a Newfoundland company.

Welland, Ont.—There is a possibility of the Union Furnace Co., of Buffalo, locating in Canada with a view to assembling Lake Superior pig iron for conversion into car wheels. The company is owned and operated by L. C. Hanna & Co., of Cleveland, and has five furnaces in operation in Buffalo.

Calgary, Alta.—Craddock & Sweeney have secured the contract for the erection of the civic storehouse and machine shop in Victoria Park. Their tender is $29,292.95.

Farnham, Que.—The Pickering Patent Wheel Co. are establishing a factory here to manufacture all kinds of wheels.

Granby, Que.—The ratepayers are being called upon to grant a loan of $5,000 to the Granby Hardware Co., who desire to establish here.

Vancouver, B.C.—The plans of the C.P.R. regarding the establishment of shops at Coquitlam will not be effected by the establishment of shops at Calgary. In connection with the new freight terminal and distribution yards at Coquitlam, car-building and repair shops will be established to look after the needs of the system in British Columbia.

Vancouver, B.C.—$2,000,000 of English capital has been secured for extending the business of E. H. Heaps & Co., lumber manufacturers. Arrangements have been completed for the erection of modern machine shops for the manufacture of internal combustion engines, motor cars, taxi-cabs, commercial trucks and motor fire apparatus. The machinery for this portion of the enterprise will be imported from England.

Fort William, Ont.—H. J. Varlow, late of the C.P.R. mechanical department, has opened a new machine shop here on George Street. He will do all kinds of repairing and make a specialty of brass founding. Mr. Varlow will also instal machinery for making repairs to gasoline engines, valves, brass work in the rough, besides all kinds of mechanical engineering, steam-fitting and steam heating.

Prince Rupert, B.C.—Mr. Love has opened a new machine and engineering shop here under the title of the Imperial Machine Works. The equipment consists of all the necessary machines for repairing machinery and engines, as well as general manufacturing.

Port Arthur, Ont.—An industry, the directorate of which is composed entirely of women, is looking for a site in Canada for the location of a plant for the manufacturing of steel tanks. Industrial Commissioner Neill is endeavoring to secure this industry for the city. The company is operating plants in the United States and owing to the great demand for their product, they have decided to establish another plant. The barrels are electrically welded, not a single rivet being used in the construction.

Brandon, Man.—The McConnell Iron Works have purchased the plant of the Brandon Implement Co. and are now in control of the property known as the Brandon Machine Works. They will carry on an extensive repair business and engage in certain lines of manufacture.

Transcona, Man.—The total cost of the G.T.P. shops here will be about $6,000,000 and from three to five thousand men will be employed. When finished, the pay-roll will aggregate from $300,000 to $400,000 a month.

London, Ont.—Work will soon be undertaken on the new civic workshops and storage houses to be erected by the waterworks department.

Sherbrooke, Que.—The Canadian Rand Co. are erecting a 100 ft. addition to their present foundry, adding 75 feet to their other shop and erecting a large building for the storage of patterns. Several new and up-to-date machines are also being installed in their machine shop.

Ottawa, Ont.—It has been announced that Ottawa and Montreal have won out against the West and will be the sites for the big repair shops and work shops for the Canadian Northern Railway.

Winnipeg, Man.—The Great Northern Railway has awarded to J. McDiarmid Co. the contract for all the new Winnipeg shops to be located at River Heights. The structure to be erected this fall includes four stall engine houses, a yard office, section foremen's house, coaling platform and some other small buildings. The site will be known as Oak Point Junction.

Vancouver, B.C.—Steps are being taken by Vancouver capitalists to establish a steel rolling mill at Steel City. At a meeting of those interested, in the office of G. M. Gibbs, W. Brown, a prominent engineer, outlined the plans and a company for the time being, capitalized at $200,000, has been organized.

Berlin, Ont.—The Ontario Adjustable Hub & Wheel Co., capitalized at $100,000, contemplates establishing here. They will manufacture a hub for wheels used on automobiles, wagons and other vehicles.

West Toronto, Ont.—A $30,000 addition is being made to the plant of the Russell Motor Car Co.

Wilcox, Sask.—Wallace & Hadley have about completed a new machine shop and garage at a total cost of $10,000. The building is 100 x 28 feet, with a separate office 20x22 feet.

Fort William, Ont.—The Universal Truck Co. contemplate establishing a plant here.

Hamilton, Ont.—The Overland Automobile Co. are taking steps to build a plant at some point in Ontario.

London, Ont.—The Harding Automobile Co. have been offered inducements to transfer their plant from here to Newmarket.

Clinton, Ont.—The Clinton Motor Car Co., capitalized at $100,000, will locate a factory here.

Woodstock, Ont.—The assets of the Maximilian Tool & Machine Co. have been sold to W. D. Karn, a director of the company, for the sum of $6,500. The company was formed by J. B. Porter, of Buffalo, to manufacture pneumatic hammers.

Peterborough, Ont.—The assets of the Rapid Tool Co., insolvent, are being offered for sale.

Sudbury, Ont.—The Sudbury Construction & Machinery Co. have erected a large addition to their present plant. It consists of a building 80 x 120 feet, of cement and steel construction throughout. The building is being equipped with a twenty-ton travelling crane and the very latest patterns of machine tools. It will be ready for occupation by the first of the new year.

Ottawa, Ont.—The C.P.R. roundhouse which is being built at a cost of $50,000 will be completed by December 1st. Close to the roundhouse a store and oil house will be built.

New Westminster, B.C.—The Schaake Machine Works, 325 Front street, have made application for lease of several water lots on Lulu Island as site for machine works, to cost $50,000.

Port Arthur, Ont.—It is the intention of the Atikokan Iron Co. to double the capacity of their furnace plant at Port Arthur, and to establish a foundry.

Welland, Ont.—The Rolling Mill Department of the Canadian Steel Foundries, Welland, Ont., which is undergoing improvement, will likely be in operation some time in December.

MUNICIPAL.

Calgary, Alta.—Several improvement by-laws were passed by the burgesses. Trunk sewer, $14,000; conduit extensions, $30,000; sewer connections, $42,000; waterworks extensions, $395,000 and street railway extensions, $375,000.

Durham, Ont.—The ratepayers have given their assent to a by-law to raise $8,000 for a waterworks system.

North Vancouver, B.C.—The ratepayers passed the money by-laws for streets maintenance, waterworks, school site purchase and fire protection.

Wynyard, Sask.—The town council passed a by-law to raise $7,000 for a municipal rink.

Melita, Man.—The ratepayers defeated the gas by-law calling for an expenditure of $4,000.

Dunnville, Ont.—A by-law calling for an expenditure of $21,000 for a waterworks system will likely be submitted to the ratepayers.

Forest, Ont.—The ratepayers will likely be called upon to authorize the installation of a waterworks system.

Sombra, Ont.—The municipality is taking steps to borrow $6,000 for drainage purposes.

Claresholm, Alta.—The town is taking steps to install a waterworks system at a cost of $8,500.

Moose Jaw, Sask.—On November 3, the ratepayers will vote on a by-law to raise $550,000 for the purpose of extending the waterworks.

Wainwright, Alta.—On Nov. 2, the ratepayers will be called upon to vote $7,000 for the purpose of building a municipal rink.

Edmonton, Alta.—A vote was taken in Edmonton to see whether the city would grant a franchise to the Universal Gas Co. or erect a municipal plant and the latter was favored by a large majority.

Galt, Ont.—The by-law to raise $10,000 for waterworks purposes was carried by the ratepayers.

Regina, Sask.—The following by-laws were passed by the ratepayers: Street Railway, $400,000; trunk sewer, $150,000; waterworks, $150,000; subway, $120,000; sidewalks and pavements, $77,800 and exhibition buildings, $35,000.

St. Boniface, Man.—There is a movement on foot here looking towards the establishment of a gas plant.

Edmonton, Alta.—During the coming financial year, upwards of $1,000,000 will be expended on waterworks and sewers.

ELECTRICAL.

St. Mary's Ont.—The Niagara power extension by-law to raise $15,000 for electric power distribution was passed by the ratepayers.

Innisfail, Alta.—The ratepayers have sanctioned a by-law to raise $15,000 for an electric light and power plant.

Waterford, Ont.—The ratepayers will shortly be called upon to pass a by-law providing $7,000 for the installation of an electric light plant.

Berlin, Ont.—The Ontario Railway and Municipal Board has validated the by-law to raise $20,000 for improvements to the lighting plant, which the ratepayers defeated.

Lindsay, Ont.—The ratepayers carried the by-law to grant a franchise to the Electrical Power Co. Two by-laws were before the people, one to give the franchise and the other to buy the local plant and inaugurate municipal ownership.

Thamesford, Ont.—The ratepayers passed two by-laws, one to purchase power from the Hydro-Electric Commission, and the other to raise $6,000 for a local plant and appliances.

Ridgetown, Ont.—At the coming municipal elections the ratepayers will likely vote on the question of buying the local electric light plant from W. H. McMeekon.

Outlook, Sask.—The council is endeavoring to secure an electric light plant for the town. Several estimates have been submitted but they have been considered prohibitive.

SAW AND PLANING MILLS.

New Westminster, B.C.—The Crown Timber & Trading Co., of Vancouver, are establishing a lumber mill here to serve the interests of British Columbia and Alberta.

Brantford, Ont.—Avey & O'Laughlin Lumber Co.'s planing mill suffered a loss of $1,000 by fire

Chatham, Ont.—The large saw mill of Neil Watson, of Mull, was completely destroyed by fire recently. The loss is estimated at $10,000, with only $1,500 insurance.

Grandview, Man.—T. A. Burrows' planing mill at Birch River was damaged by fire, but the loss is fully covered by insurance.

Calgary, Alta.—The Riverside Lumber Co. will erect a box factory here as an addition to their already large plant. It will employ about 100 more men.

Fort Frances, Ont.—The Heins Lumber Co. are contemplating the establishment of a saw mill and plant here.

Rock Island, Que.—Butterfield's have about completed their new wood shop, and will employ eight men.

Bedford, Que.—Best Bros. are building a sash and door factory here, 36x50 ft. and equipped with the latest modern machinery. An electric light plant will be run in connection with the factory.

BUILDING NOTES.

Montreal, Que.—The C. P. R. announce that they will spend over five million dollars in extending and rebuilding hotels. The whole system from the Atlantic to the Pacific will undergo extensions and alterations.

Vancouver, B.C.—Plans have been filed for the new Dominion Government warehouse to be erected at a cost of $330,000. It will be six storeys high and 104x120 feet.

Guelph, Ont.—The new Homewood Sanitarium is being rebuilt at a cost of $200,000. The work will be completed by April 1, 1912.

Vancouver, B.C.—$500,000 covers the estimates of the contractors ror the steel viaduct across the arm of False Creek. The ratepayers will be asked to vote the necessary money at the forthcoming elections.

Kingston, Ont.—Boston capitalists are preparing to erect a $200,000 hotel here next spring. The city is being asked to guarantee the bonds of the company to the extent of $100,000.

Vancouver, B.C.—Oliver Lightheart has prepared plans for a seven-storey apartment house, to cost about $300,000.

Calgary, Alta.—T. J. S. Skinner will erect a ten-storey block here, to cost about $250,000.

Toronto, Ont.—The publication board of the Baptists are preparing to erect an eight-storey building here. This announcement was made at the Montreal convention recently.

Victoria, B.C.—The Oddfellows are contemplating the erection of a three-storey building, to cost $140,000.

Victoria, B.C.—Atkinson & Dill, contractors, have secured a permit for a six-storey building to cost $126,000. There will be 105 offices, each with hot and cold water connections and steam heat.

Toronto, Ont.—Geo. Wright, part owner of the Caer-Howell property, is having plans prepared for a ten-storey apartment house, to contain 42 suites.

Moose Jaw, Sask.—The Canadian City & Town Properties Co. are preparing to erect a five-storey building here, to cost about $300,000. It will be 108x125 feet.

Yorkton, Sask.—The Sisters of the Sacred Sacrament, of Anton, France, are preparing plans for a $150,000 hospital to be located here.

GENERAL MANUFACTURING.

Galt, Ont.—F. T. & C. Appleby are erecting a plant here for the manufacture of cement blocks, sills and brick.

Fredericton, N.B.—The John Palmer Co. will erect a larrigan factory plant here, to cost $25,000. The new building will be of brick and stone and 250x50 feet.

Toronto, Ont.—The Standard Silver Plate Co. will erect a factory on Madison Avenue, to cost $75,000.

Orangeville, Ont.—The Hamilton & Lewett Knitting Co., of Glencoe, contemplate establishing a factory here.

St. Stephen, N.B.—The Buffalo Fertilizer Co. propose building a wharf and warehouse here to cater to the eastern trade. They expect to invest $25,000 in their buildings and plant.

London, Ont.—The Greene-Swift Co. will add a three-storey addition to their plant here in the spring.

Tavistock, Ont.—Bennewitz & Shultz, of Toronto, contemplate establishing a factory here to manufacture accessories for musical instruments. They are seeking a loan of $6,000 from the town.

North Battleford, Sask.—The North Battleford Manufacturing Co. has decided to enlarge its plant and will erect a $50,000 factory.

London, Ont.—The Battle Creek Toasted Corn Flakes Co. are contemplating the erection of a $65,000 factory in the east end.

Welland, Ont.—The Bratton Automatic Sales Co., manufacturers of peanut, weighing and gum machines, are establishing a factory here.

Sarnia, Ont.—$500,000 will be expended in extending and improving the plant of the Imperial Oil Co. here.

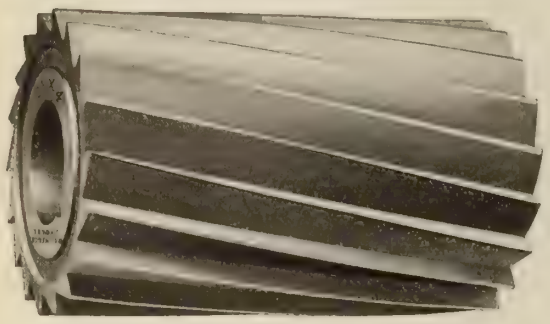
Vancouver, B.C.—It is said that $2,000,000 English capital has been secured for the extension of the E. H. Heaps & Co. lumber business. The company are now operating a sawmill, planing mill and a sash and door factory in the east end, an Burrard Inlet. New mills on a larger scale will be erected alongside the existing plants. A sawmill will also be erected at Ruskin; also a planing mill and a sash and door factory.

South Vancouver, B.C.—The Coast Lumber & Fuel Co. will establish a distributing plant here. New buildings will be erected and about 100 men employed.

NEW EQUIPMENT REQUIREMENTS.

Welland, Ont.—The Canadian Automatic Transportation Co., head office, 703 Confederation Life Bldg., Toronto, C. H. Craigie in charge, require lathes, drills, shapers, etc., all machine shop appliances, for their factory. Shop is electric driven and has electric heating.

Weymouth, N.S.—The Blackader lumber mill, near Weymouth, N.S., was totally destroyed by fire October 4th, loss $25,000. They intend building at once a wooden structure and equipping it with all required machinery in their line; steam plant, turbines, steam heating, dynamos, piping, saws, planers, etc.



Walkerville, Ont.—Work is in progress for erection of a factory for the Auto Top Co., three-storey, 250x81, electric lighting, steam heating. Machines for making auto tops, engines, boilers, etc.

Brandon, Man.—Cold storage building, cost $15,000, for Brandon Creamery Co., Brandon; contractor, A. Newert, Brandon; two-storey, brick exterior, electric lighting, gravel roof, steam heating, fire escapes, refrigerators, telephones, dynamos, motors, etc.

Walkerville, Ont.—Equipment is required for power plant for Ford Motor Co., brick construction. Telephones and elevators, boiler and engines to be purchased.

Calgary, Alta.—The Crown Lumber Co., grain exchange, will build a new store, cost $5,000; frame, 32x125; electric light will be installed and mill machinery required.

Chatham, Ont.—The McGeachy Dairy Co., Chatham, will install boiler and engine and latest dairy machinery and electric fittings

Hardening a Cutter is the only process in its manufacture that does not depend upon mechanical means for its success.

The first steps in the manufacture of accurate cutters—turning the blank, boring, cutting the teeth, etc.—are dependent upon accurate mechanical means. The same is true of the last step—sharpening.

When it comes to hardening, the very opposite is true. No mechanical means have been found that will successfully perform the work—all depends upon the skill of the workmen and their experience.

Our men are highly skilled and have the experience of more than half a century of hardening to back them.

Shall we send our Cutter List?

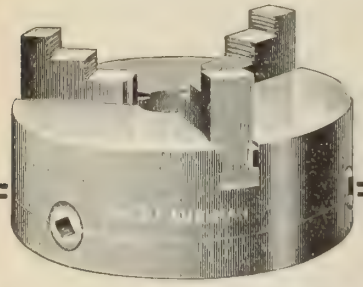
Not an Enterprise for the "Quitter"

"If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

"He must know before he begins it that he must spend money—lots of it.

"Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.



"Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

Hartford, Conn., U.S.A.
Established 1862

and steam heating in the new factory. Building now in course of erection.

Calgary, Alta.—Work is in progress for erection of a laundry to cost $10,000 for Christie Bros.' Ontario Laundry; two storeys, 50x130, solid brick and concrete, concrete foundation, steam heating, electric lighting, gravel roof, concrete interior finish, boilers, engines, dynamo, laundry machinery. Excavation being done. Contract for superstructure not settled yet.

Delhi, Ont.—The Delhi Canning Co. contemplate extensions. New machinery required.

Galt, Ont.—Machinery required for a factory for Canadian Motors Limited; engine, boiler, presser, lathes, etc. Brick and concrete; architect, Wm. Scott, Galt.

Lake Nominingue, Que.—Sawmill destroyed on the 5th inst.; loss, $30,000. It will probably be rebuilt. Company will require hydraulic turbines, dynamos, steam power plant, saws, planers, piping, hose, etc.

Brockville, Ont.—Extension to factory to cost $2,500 on Mill Street, for D. H. Burrell & Co., Brockville. Masonry contract, Haggarty & Co., Brockville; two storeys, 35x42, brick, exhaust-steam heating, electric lighting. Factory machinery will be required.

Addition to factory for Cossitt Company. Masonry contract, Pattison & Fox, Brockville; carpentry, Brown & Co., Brockville; two storeys, 40x50, brick, exhaust-steam heating, electric lighting, composition roofing, one freight elevator. Factory machinery required.

TENDERS.

Prince Rupert, B.C.—Tenders are called for supply of about 1,800 tons of C. I. pipe, 6 in. to 18 in. in dia.; 38 tons special castings, a quantity of gate valves, valve boxes and hydrants. Received until November 20 by City Clerk, E. A. Woods; City Engineer, W. M. Davis.

Berlin, Ont.—The County Council of Berlin and Waterloo will purchase $3,000 worth of road machinery shortly.

High River, Alta.—Plans are being prepared for water works and sewerage. Engineers, Chipman & Power, Mail Building, Toronto; 17 Canada Life Building, Winnipeg, and Dauphin, Man.

Ridgetown, Ont.—Tenders will be called shortly for a fire pump, gasoline engine and a producer gas engine in connection with the new waterworks system. Engineer, C. E. Farncombe, London.

TRADE NOTES.

The Canadian Buffalo Forge Co., Montreal, has recently shipped a number of large steel plate exhaust fans to various parts of Canada. Two of the largest of these were installed for the Saraguay Electric and Water Co., Bordeau, just outside of Montreal. They are 170 inches in diameter, and are to be used for induced draft for 3,000 boiler horse power. Either fan alone has capacity to take care of the entire plant, leaving one in reserve. The fans are engine-driven with automatic speed regulator valves to keep the boiler pressure uniform by controlling the draft.

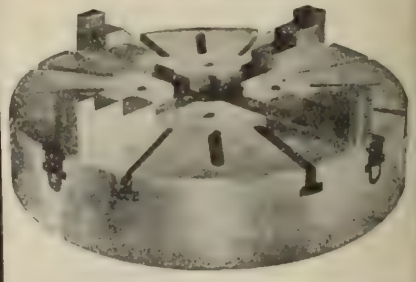
The Kelly Reamer Co., Cleveland, O., have recently opened offices at 96 Reade street, New York, 170 Oliver street, Boston, and 112 Queen Victoria street, London, England.

The Siemens Bros.' Dynamo Works have opened an office at 707 McArthur Block, Winnipeg.

Goold, Shapley, Muir, Brantford, Ont., will install water system for fire protection at the Jordan Sanitorium, River Glade, N.B. The system includes a 20,000 gallon tank erected on a 60-ft. steel tower and supplied with water from river by a hot air engine.

At a meeting of directors of the **B. Greening Wire Co., Ltd.,** held recently, Mr. H. B. Greening, who has been managing-director of the company for the last twelve months, was appointed president in place of his father, the late Mr. S. O. Greening. The board of directors is now composed of H. B. Greening, John Maw, N. S. Braden and R. H. Merriman. The officers of the company are: H. B. Greening, president and managing-director; R. H. Merriman, secretary; and F. J. Maw, superintendent. Mr. F. J. Maw is a son of John Maw who was superintendent from the incorporation of the company in 1889, until a few years ago when he retired from active management.

Port Colborne.—All signs point to exceptional industrial developments here next season. Negotiations are under way for securing the Union Furnace Co., Buffalo, to locate here. They manufacture car wheels, etc. The company is owned and operated by L. C. Hanna & Co., Cleveland, and Henry Yales, the Buffalo capitalist, is president. The company will employ two hundred men.



Doubling the size of the cement plant here will cost $700,000, and it will employ six hundred men.

The Robinson Bros. Cork Works are also making arrangements to greatly enlarge their

plant, and will double the number of their employees.

The Chamberlain Hooklam Switch Co. will open an office in Montreal shortly, for the purpose of administering their Canadian trade. Mr. S. L. B. Lines, a gentleman of wide experience in the firm's business, will be in charge. House or car meters and Venner automatic time switches, operated by 45-day winding clocks, which switch lights on or off in halls, streets, apartment houses as desired, are among the specialties to be handled by the Canadian house. This time switch has been approved by the British Board of Trade, and is equivalent to our Electrical Standards Laboratory. Their house meter is claimed to have a high ratio of torque to weight of moving element, thereby giving it a correspondingly high range of accuracy. A 220 volt meter will give accurate readings on 110 volts. Mr. Ernest E. Sharpe is now in Canada arranging preliminaries.

The Smart-Turner Machine Co., Hamilton, report the following orders recently received. Duplex plunger pump with pot valves, the International Harvester Co., Hamilton; centrifugal pump, the Zimmerman Mfg. Co., Hamilton; duplex pump, H. H. Weller, St. Catharines; centrifugal pump, the Colonial Wood Products Co., Thorold; duplex pump, the West Lorne Canning Co., West Lorne; triplex power pump, the Vineland Canning Co., Jordan, Ont.; two hydraulic pressure pumps, the Harris Abattoir Co., Toronto; duplex pump, the Beamsville Preserving Co., Beamsville; duplex pot valve pump, the Goldie & McCulloch Co., Galt; duplex pump, the John C. Mundell Co., Elora, Ont.; traveling cranes, the Ocean Falls Co., Vancouver, B.C.; independent jet condenser, Gunns Limited, Toronto.

The Kerr Engine Co., Walkerville, Ont, the well-known valve manufacturers, has commenced the manufacture in Canada of the "Simmons Patent Packless Valve," better known in the United States as the C. H. S. packless valve. It is claimed by the manufacturers to be perfectly packless, and an all-metal valve, there being no destructible composition rubber rings, or discs in the packless feature. The valve is substantial in construction, and one which will doubtless fill a long felt want in the heating trade, and especially on vacuum systems.

C. P. R. ANNUAL MEETING.

The feature of the recent annual meeting of the shareholders and directors of the Canadian Pacific Railway was the general tone of optimism visible in all the reports submitted, and a general provision all along the line for greater business and greater expansion during the coming year.

The executive as a whole was re-elected, and Sir William Van Horne, Messrs. H. S. Holt, E. B. Osler, R. B. Angus, whose terms as directors had expired, were again elected to their places on the board.

Sir Thomas Shaughnessy, on taking his place as president of the railway, was presented with the congratulations of the shareholders on the success of the railway during the past year.

Nothing was done in the appointment of a successor to Sir William White, although his appointment to the board of directors to take the place of the late Robert Meighen was approved.

It is reported, however, that Mr. Bury, the general manager of the western lines, was appointed at the meeting of the board of directors, which was private.

The western shops of the railway, Sir Thomas Shaughnessy announced, would be erected at Calgary if satisfactory arrangements could be made with the city authorities.

A policy of great expansion in the direction of steamship transportation was provided for by the authorizing of the issuance of $800,000 worth of 4 per cent. debentures for the steamship account.

Authority was also given for the issuing of a large debenture to an amount not mentioned for the branch line account.

JOHN H. HALL & SONS, BRANTFORD.

In view of the increased demand for pipe-threading machines and grey iron castings, John H. Hall & Sons have acquired an interest in the Brantford Foundry, better known as the Burrill Foundry Co. The new concern will be known as the John H. Hall & Sons Foundry Co. George E. Forsythe and Norman J. Prowse, the former proprietors of the foundry, retain an interest. The new concern is well equipped to handle not only large quantities of work, but the most intricate and difficult castings in grey iron, brass and aluminum. It is the intention to cater to the growing demand for jobbing castings, as well as surplus work from large factories, which, with the regular line of work and contracts on hand, will necessitate the employing of 25 men in the new foundry.

The present factory of John H. Hall & Sons, on Bridge Street, is also undergoing many changes and extensions, they having already let the contract for an enlargement which will nearly double their capacity. All the adjacent land obtainable has been purchased, and building operations are now under way. The new addition will be used for erecting purposes only; a traveling crane of latest design will be installed, to give every convenience for the handling of heavy work. Each department is under the personal direction of one of the firm, which consists of Mr. Hall, Sr., and four sons. By giving attention to all details, they have built for themselves such a reputation that now, with the most improved equipment, blacksmith shop, draughting room, pattern shop, foundry and machine shop, they are unable to meet the demands for their products, hence this latest extension.

The firm has been manufacturing a full line of pipe-threading machinery and have placed machines in all the tube mills in Canada, as well as some of the largest plumbing and steamfitting companies. Arrangements have also been made with an American concern to build and operate electric welding machines, the exclusive Canadian agency for same having been secured.

LINDE CANADIAN REFRIGERATION CO., LTD.

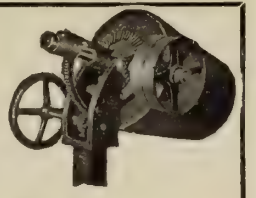
Mr. C. W. Vollmann, who for the past fifteen years has been carrying on business in Canada under the firm name of "The Linde British Refrigeration Company, Limited, of Canada," is continuing the same business under the style of The Linde Canadian Refrigeration Company, Limited, with offices at 37 St. Peter Street, Montreal. Sixteen years ago Mr. Vollmann made an arrangement with the Linde British Company by which he was to have the exclusive right to manufacture "Linde" machines in the Dominion for a stated period. This agreement expired last February. The British Company then decided to send a representative to Canada to look after their interests and Mr. Vollmann changed the style of his firm name to prevent confusion. Mr. Vollmann is the president of the Linde Canadian Refrigeration Company, Limited, which is financed by Canadian capital and managed by a Canadian board. This firm will continue to sell and instal the Linde type of refrigeration plant.

CHANGE OF FIRM NAME.

The Canada Wire Goods Mfg. Co. announces a slight change in the firm name, which hereafter will be known as **Canada Wire and Iron Goods Co.** The change is simply for the purpose of better designating their lines of manufacture, and incidentally to break the similarity of their name with other manufacturers in Hamilton. There has been no change in the management which consists of Wm. Holmes and Alexander Donald, both of whom have been long and favorably connected with the Wire Industry. The principal lines manufactured by this company are Double Crimped Wire Cloth of all grades, Coal and Ore Screening, Perforated Metals, Metal Clothes Lockers, Ornamental Wire & Wrot Iron Office and Bank Railing, Grilles in all finishes and General Wire Work. The plant of the **Canada Wire and Iron Goods Co.** has been enlarged during the present year by fully one-half of its former capacity, resulting in a greatly increased output. The Company is about to issue a new general catalogue which a post card will bring. The Company's agents are: R. A. Ogilvie, P.O. Box, 856, Vancouver, B.C.; J. S. Parkes, 446 St. Paul St., Montreal, Que.; D. Phillip, 291½ Portage Ave., Winnipeg, Man.

THE NOVA SCOTIA CAR WORKS.

Halifax, N.S.—The directors of the Nova Scotia Car Works made an inspection of the plant recently. There were present: O. E. Smith, president; J. W. Allison, F. B. McCurdy, M.P.; S. M. Brookfield, F. Stanfield, M.P.; A. M. Bell, of Halifax, and Hon. J. R. Lamy and J. R. Douglas, of Amherst. The directors were accompanied by F. M. Brown, vice-president and general manager, and C. F. Rydeberg, superintendent. J. R. Macleod also was present.



The new office building, the upper floor of which will be used by the drafting department, was first visited. Then a tour was made of the power house, the car mill, the forge shop, the machine shop, the foundry and the erecting shed. The piers for the steel underframe building, which will be in operation in December, were inspected.

A new air compressor has been added to the power department and throughout the plant there have been large additions to the mechanical equipment. It is now turning out an average of twelve cars daily, and over 500 men, well organized to accomplish the best results, and equipped with the latest labor-saving devices, are employed. The output of box cars will be still further increased and

GALT FOUNDRY CO, GALT, ONT.

the plant for making steel underframe cars will add yet more to the output. The directors expressed satisfaction with their inspection.

CANADIAN CAR & FOUNDRY CO.

The Canadian Car & Foundry Co., of which N. Curry is president, have some important building operations in hand with the object of increasing their capacity. At Turcot, near Montreal, their facilities for constructing passenger cars will be doubled, which will enable them to turn out 12o cars per annum. They have just completed a steel car plant for building steel under-frames and composite cars. The shops at "Dominion," just outside Montreal, are also being extended, to the extent of 50 per cent.; at this place "all steel" cars are constructed.

The Canadian Steel Foundries, an allied concern, are erecting a plant at Longue Pointe, at a cost of about a million dollars, which will be ready at the beginning of the year. The Dominion Bridge Co. are furnishing the steel work; C. E. Deakin is doing the balance of work on the main building; and the Bishop Construction Co. and C. E. Deakin have some work on minor buildings.

The buildings, etc., cover 35 acres, at Longue Pointe, and the company will have a capacity of 25,000 tons of steel castings per annum; this includes manganese steel, switch work, and othfer material used in street and steam railway construction.

CATALOGUES.

"Storage Battery Cars" is the title of Bulletin No. 13, just issued by the Gould Storage Battery Co., 341 Fifth Ave., New York. This bulletin explains the economics of the storage battery car, describes the standard type made by the Gould Co., and cites the conditions under which storage battery cars can be used most profitably. A copy will be sent on request.

Bulletin No. 36 of the Bates Machine Co., Joliet, Ills., describes and illustrates the new Bates Inertia Valve Gear, which is now regularly applied to all Bates Corliss Engines. This new gear has attracted much attention because of its positiveness and quiet operation, and the absence of hooks, springs and rollers.

"Something out of the Commonplace," in catalog form 15, just off the press, gotten out by the Hess Flume Company of 635-636 First National Bank Building, Denver, Colorado, and showing their metal flumes as used for irrigation, power, mining and substructures for various purposes. This interesting booklet is printed in what our printer friends call "reverse," that is, the type and the pen drawing illustrations are in white, and the paper a dark blue, imitative of the blue-prints with which we are all so familiar. This catalogue is unique and interesting, for it contains much information on the subject of flumes in general, of real value. Two pages are devoted entirely to tables of the carrying capacity of different sized flumes and various specifications. These should be helpful to the engineer or in fact to anyone figuring an such work.

The Hess Co. claim two advantages for their improved galvanized toncan metal flumes. First, the fact that they are made of toncau metal sheets, supplied by the Stark Rolling Mill Co., Canton, O., and which are claimed to be particularly adaptable to meet the severest conditions and exposure. Second, they claim that the Hess is the only flume with a perfectly smooth interior. The interlocking sections are easily assembled, and a watertight joint is secured without the use of either solder or rivets. This joint offers absolutely no obstruction to the flow of water. The catalogue illustrates this joint, and the pen pictures show in detail the construction of the Hess flume. At the bottom of each page are different little pert reminders, in bold handwriting, that the Hess flume is made of rust-resisting toncan metal sheets. The other lines, metal lumber substructures, metallic intakes and outlets, headgates, pressure pipe are each briefly mentioned and described. Judging from both the standpoint of originality and from that of practical utility, the Hess flume catalogue is a most unique and interesting book, well worth the perusal of everyone interested.

We have received from **Gould and Eberhardt, Newark, N.J.**, a handy little scale showing suitable speeds for milling cutters, both carbon steel and high speed. On the other side of the card are given proportions of gear teeth from 1 to 16 diametral pitch. The card is enclosed in a neat celluloid case, having slots cut in it, so that only one line of figures is read at a time, thus saving one much trouble in picking out the information desired. Gould and Eberhardt are the well known builders of automatic gear-cutting machinery and high duty shapers.

John Acton, 118 John St., Brooklyn, N.Y., has forwarded us a copy of his newly-issued catalogue of modern automatic steam, water, air and vacuum specialties. These include reducing valves for both high and low pressure service, pump regulating valves, relief valves, etc., etc.

Chas. L. Bailey
80 Bay St.
Toronto, Ont.

We have received from the **McGraw-Hill Book Co., New York**, their latest list of books dealing with electrical engineering. Books on all branches are listed, and those interested would be well advised to secure a copy.

The Patterson-Allen Engineering Co., Jersey City, N.J., have favored us with a bulletin describing their machine for uniting flanges with wrought iron or steel pipe by hydraulic pressure. This process is capable of putting flanges on pipes of any diameter from 2 to 20 inches, and of any thickness, at insignificant cost. The machine operates automatically, no skilled labor being required.

The Stevens Co., of Galt, Ont., send us a little booklet setting forth the advantages of the Gronkvist chuck for straight shank drills. In this chuck the shank is gripped by three hardened steel rollers bearing upon hardened eccentric curves, so that the greater the strain the tighter the drill is held.

The Cincinnati Pulley Machinery Co., Cincinnati, Ohio, have favored us with a set of bulletins descriptive of their various machines for boring, turning and tapping cast iron pulleys. They also make the Avey sensitive drill press. This is a high speed, ball bearing press, built with from two to six spindles, and has a capacity up to ⅞-inch drills.

The Union Twist Drill Co., Athol, Mass., have favored us with a copy of their new Catalog F, which lists gear cutters, milling cutters, twist drills, sockets, etc., for which the firm enjoys a wide reputation. The catalogue is attractively got up and is of convenient size for reference.

The Canada Wire and Iron Goods Co., Hamilton, Ont., have issued their Catalogue No. 3 which gives full particulars of their line of manufactures in wire cloth and perforated sheet metal. These are too numerous to refer to, more particularly as the firm's motto "If it's made of wire, we make it," sufficiently proves.

BOOK REVIEWS.

Vol. X, the tenth annual edition of the Copper Handbook, is just received. The new issue of this work, which is considered a standard authority on the subject of copper and copper mines for the entire globe, has 1,902 octavo pages, containing nearly 1,500,000 words, and, in addition to the miscellaneous chapters, lists and describes 8,130 copper mines and copper mining companies, in all parts of the world, this being the largest number of titles ever listed by any work on mining. The descriptions range from two or three lines, in the case of dead companies, wherein reference is made to detailed descriptions in past volumes at the period of their activity, up to twenty-one pages in the case of the Anaconda mine, which yields one-eighth of all the copper made in the world.

The miscellaneous chapters of the book, twenty-four in number, treat the subject of copper from all possible viewpoints, there being chapters on the history, chemistry, mineralogy, metallurgy, brands and grades, alloys and substitutes of copper, with a copious glossary, and a chapter of statistics ending the book that contains 40-odd tables, thoroughly covering copper production, consumption, movements, prices, dividends, etc. The Copper Handbook is sold on the unique plan adopted nine years ago, the publisher sending the book by mail, prepaid, to any address ordered, without advance payment of any sort, and subject to return after a week's inspection. The price is $5 in a strong green buckram binding with silk headband and gilt top, or $7.50 in full library morocco. Anyone interested in copper, as a producer, consumer or investor in shares, would do well to write the author and publisher, Mr. Horace J. Stevens, Houghton, Michigan, ordering a copy of the new Copper Handbook sent prepaid, subject to approval.

The Westinghouse Electric and Manufacturing Co. have just issued the first edition of an attractive monthly publication entitled "Small Motors," which is devoted to forming a co-operative bond between the manufacturer and the dealer in small electric motors for general household, store and office work. The contents are devoted to practical applications of small motors, showing views of them in such actual service as operating ice cream freezers, small lathes, washing machines, grinding wheels and numerous household devices.

An interesting application of the small motor for the household is its use as an auxiliary to the furnace, assisting the heating and ventilating of same, by means of a blower attachment. Advice as to installation, operation and care of motors is given in short, practical talks.

"Pointers for Inventors" and **"Pointers for Patentees"** are the titles of two little booklets by Egerton R. Chase, Patent Attorney, Temple Building, Toronto, at a price of 25 cents each. The first book deals with methods whereby inventors secure capital to patent their inventions, and the second with methods whereby patentees are successful in selling their patents or manufacturing rights thereunder. We can confidently recommend these little books to the attention of all inventors.

Bakelite Valve Discs

One Disc for all Purposes

Replace Soft Discs, Hard Discs and Metal Discs.

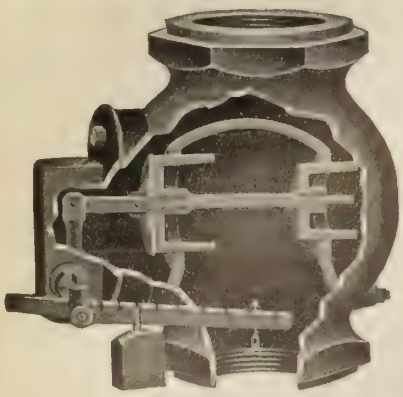
NOT till this wonderful material —BAKELITE—was invented could a composition valve disc or pump valve be found that would not soften, fuse or crack from moisture, steam or chemicals.

Every engineer knows this. BAKELITE is the new material which has brought valve troubles to an end.

BAKELITE stands an enormous amount of friction wear.

Your leaking valves with frequent replacement of the discs are not necessary. Put in Bakelite Valve Discs and the leaking will cease. This is the only material in the world that embodies in one disc the advantages, not only of the usual soft and pliable discs for water, but also of the hard and tough composition discs or special metal discs for the hottest steam. They cost less than metal.

Made for all sizes and types of valves. Ask your dealer or write us.



PLASTICS Limited

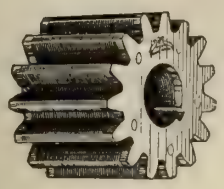
GREAT SAVINGS Result from the Use of

GOODHUE BELTINGS

As they stretch from 15% to 25% less than any other belting and save much money that would otherwise be wasted by paying a man to shorten the belt.

The extra care in stretching the belting before it is placed on the market and the rejection of all unstretched parts account for "GOODHUE" undoubted superiority over all other brands.



According to the conditions in which the belt has to be used we recommend our "EXTRA," "STANDARD," or "ACME," Waterproof Belts.

We invite comparison, because it is our greatest advertisement. ***Write us at once.***

New Process Pinions tell a silent story; Metal pinions can't.

As a user of high speed metal pinions, you know they invariably get noisy. Every busy man has enough unavoidable distraction without avoidable gear noises. Useless noise is therefore unprofitable, for it interferes with the work of the shop and office forces alike.

New Process Pinions do NOT distract attention. They permit orders to be clearly understood without the foreman having to shout, they permit concentration of mind and energy upon productive work and make the atmosphere in the shops more agreeable for everyone.

Our literature would be intensely interesting and valuable to you. Write for it.

Oneida, N.Y.

THE BULL DOG GRIP

"Keeping everlastingly at it brings success" is a trite but true saying, and the most important word in the aphorism is "everlastingly." That's why the bulldog wins in the fight. He growls an introduction, rapidly spunks to fighting speed, jumps in and grabs for good. He's got the doggondest grip—a reinforced concrete jaw grip that won't let go, an everlasting grip that gives 100 per cent. efficiency execution.

So with the POSITIVE Combined Jaw and Friction Clutch, the frictions quickly take hold of the load shaft at rest and bring its speed up to that of the power shaft; then the steel jaws jump in at full speed and grab the power by the nape of the neck. They hold, and hold, and hold everlastingly.

There's no slip, no loss of power, no loss of money—and there's no "bark" in this argument. You can feel the money saved—and money feels good. That's why the POSITIVE Clutch will bring success in your mills or shops—because it actually controls and distributes power with 100 per cent. efficiency, because it doesn't let go, because you can depend upon it to stick to the job everlastingly, because it, too, has the doggondest grip —the Bull Dog Grip.

Machinery Wanted and For Sale

To the Readers of 'Canadian Machinery'

On page 87, October edition of Canadian Machinery appeared one of the greatest offers yet offered to its readers. Read the advertisement mentioned, and then carefully consider this offer. Subscribers to

Twenty Century Mechanics

are wanted, and SATISFIED SUBSCRIBERS above everything else, therefore I personally agree to refund your money if, after receiving the Twenty Century Mechanics for one year, you feel you did not get value received. I have faith in you—that is why I make this offer. Also, I know that Twenty Century Mechanics will exceed your expectations, and for that reason I can afford to make the above offer. You are to be judge; your word is final, and I hope you will SUBSCRIBE AT ONCE. The Subscription is ONLY $1 per year. Address,

H. S. Jeffery, President
Jeffery Correspondence Schools,
Washington, D.C.

The Wheels Your Men Can Depend Upon

ALOXITE GRINDING WHEELS

When an Aloxite wheel is put on the arbor it stays there until worn out. No question about its work—fast, clean, cool-cutting every minute—no rasp or screech—cuts easily, quietly.

The man in the illustration is grinding lathe tools in a Philadelphia shop. He is using a 16-inch *Aloxite wheel.* Both he and his foreman say it is the best wheel they ever had in the place—holds its shape—never glazes—doesn't burn the tools.

Your **men wouldn't ask for a better wheel—They couldn't get it. Let us help you get the right wheel in the right place.**

FREE INSTRUCTION BOOK

SEND FOR IT TO-DAY

This book should be within instant reach of every engineer. It tells clearly, by photograph and formula, how to use the well-known Smooth-On Iron Cements in repairing boilers, engines, castings, tanks, joints, etc.

Used according to instructions, Smooth-On Cements will save more actual time and money in the engine and boiler room than any single product manufactured. Their uses are innumerable, and their repairs absolutely permanent.

A GOLD MINE

SAVE YOUR IRON

SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

The Making of Hollow Castings

The recent introduction of King Kore Kompound has now rendered this, once somewhat difficult, part of Foundry practice comparatively easy.

It has, also, reduced the core expense by more than one-half.

This compound is a black, dry powder, and is used as flour is used, but with one-half the quantity is produced greater and better results.

Its use avoids the danger of swelling or "blowing." The core easily comes out of the casting, and when old cores are ground up, in the rattler, or otherwise, the sand so made is used over again.

The core compound it contains, again becomes a binder under heat of the core oven, as it melts, and so it is used over and over again.

This is Foundry Economy; Flour, Rosin, etc., are now luxuries.

A barrel of King Kore Kompound will be sent "subject to approval" to any inquiring mind.

That is the Stevens' System of trying before buying.

I have copies of proportions of compound to sand used and methods followed in core rooms of Foundries in thirteen different States. This information, with other printed matter relative to the subject, will be mailed on request.

I maintain a direct branch at 137 Jarvis St., Mr. J. M. Mayers, Manager, Toronto, Ont., where is stocked a supply of Foundry Facings, Foundry Supplies, Buffing Compositions, of my own manufacture.

The stamp of quality pervades them all.

FREDERIC B. STEVENS

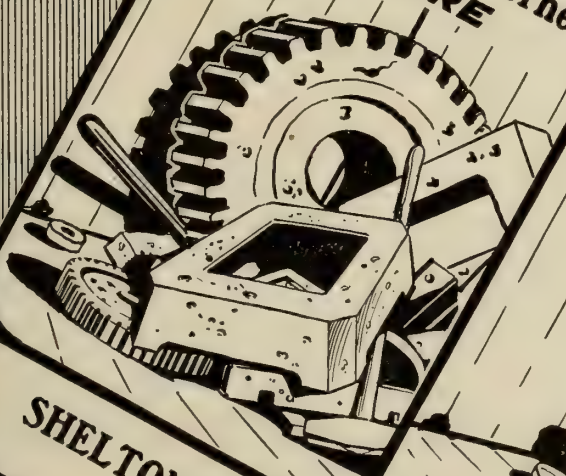
Main Office - - - - - - DETROIT, MICH.

Canadian Branch - - - 137 Jarvis Street, TORONTO.

"Actions Speak Louder than Words"

RESULTS!

PERFECT CASTINGS



Shelton Metallic Filler

INSURES PERFECT CASTINGS. It obliterates Blowholes, Sandholes and all similar defects. It makes the Casting look as tho' it came from the mold ABSOLUTELY PERFECT.

Don't throw the imperfect casting on the scrap-heap. A little Shelton Metallic Filler will make it pass the closest inspection—you know what that means—it will save the cost of a "make-over,"—it will put bigger profits into your business. It's guaranteed to do the business.

Test it at our expense. Let us send you a sample can free of charge.

OXYACETYLENE and all systems of WELDING and CUTTING PLANTS.

For welding steel, cast iron, copper, brass, lead, aluminum you to KEEP YOUR SCRAP HEAP CORNER EMPTY. For cutting steel and wrought iron. It helps

Have your broken castings repaired. Do not lose time waiting for new castings. They can be repaired by welding the cracks and broken parts by the autogenous welding process and made as good as new.

Blow holes in rough or machined castings of any metal filled up. Holes drilled by mistake filled up. Broken or cracked gasoline engines and automobile cylinders welded. Broken or cracked pulleys, gear wheels, etc., welded. Flanges welded on pipes. Metal added on parts worn out by friction. Teeth renewed on broken gear wheels. ***Transformer tanks and all kinds of tanks entirely made by welding, absolutely water or oil tight and to stand pressure.*** Cutting steel or wrought iron of any thickness and in any position. Cracks and corrosions in boilers a specialty.

OXYGEN

of guaranteed purity made by the Claude's Process. The largest and most up-to-date plant now in operation on this continent. Is supplied at a low price to all users of the process.

Sample and Repair Work Undertaken.

R. J. LEVY, Manufacturer of Oxygen **Maisonneuve, Montreal**

Telephone East 6713 Let Us Send You Full Particulars

Canadian Agent for the "Societe L'Air Liquide" Paris

DID YOU EVER HEAR OF STANDARD TUBING?

¶ Maybe not, but you've seen millions of feet of it, for the frame of nearly every bicycle and motorcycle is made of it.

¶ Standard Seamless Steel Tubing is made of strips rolled accurately to gauge. These are then folded into tubular form, the edges heated, under lateral compression, by electricity until they conjoin into one homogeneous mass, producing a tubing as perfect and as whole as the product of a mold. They then pass through finishing operations and inspections which guarantee to the buyer a tubing whose strength, density, accuracy, and finishing surface, cannot be excelled.

¶ Being light, durable, and manipulative, the uses to which it can be put are innumerable, ranging from clock work to aeroplane frames.

¶ It might benefit you to look over your product for the purpose of determining whether you can use Standard Tubing. If you can, your costs will be reduced, and the quality of your product improved.

STANDARD WELDING COMPANY

"PIONEERS WITHOUT PEERS."

CLEVELAND, O., U.S.A.

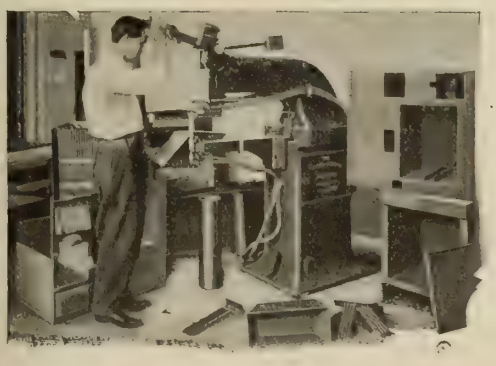
FOUNDRY MOULDING MACHINES FOR ALL KINDS OF FOUNDRY WORK



Standard and Other Types to Suit Conditions

THE TABOR MANUFACTURING CO.

18th and HAMILTON STS. PHILADELPHIA, PA., U.S.A.

THE ELECTRIC WAY OF RIVETING

NO HOLES TO PUNCH. NO RIVETS USED.

What a Stove Manufacturer Says:

"We welded 655 sheet steel ranges and 582 closets last month with our new "Toledo" welding machine.

Our current cost	$ 5.75	
Total labor	87.00	$ 92.75

" Before buying your welder we riveted these ranges and closets. We paid for riveting 35c per range.

655 ranges at 35c	$229.55	
Rivets	8.50	$238.05

" We saved $145.30 on this work alone in one month."

Another Manufacturer

put a " sod buster " at work on his welding machine. He's welding 18 and 20 gauge steel. The current costs 50c per day at 8c per K.W. He averages 1650 welds per hour. That's how fast he did it and a better job than the old way of riveting.

ISN'T THAT INTERESTING?

Better write to-day and let us show you in actual figures whether a saving can be effected in YOUR work.

NO LEASE. NO LICENSE. NO ROYALTY.

Our sheet metal worker's hand book will tell about it, and it's yours for the asking.

THE TOLEDO ELECTRIC WELDER CO.

" CUMMINSVILLE," CINCINNATI, OHIO, U.S.A.

BUTTERFIELD

TAPS, DIES and REAMERS

Made of the highest quality material obtainable.

Hardened and tempered by a special process

"BUTTERFIELD" Tools are thoroughly tested before leaving our works, thereby assuring a dependable product that has no equal.

Do not hesitate—write for catalog and prices at once.

All our goods are guaranteed.

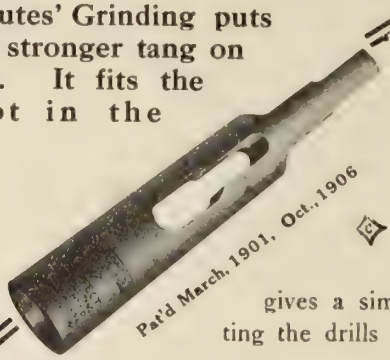
"MORSE"

TWIST DRILLS
REAMERS
MILLING CUTTERS
OF CARBON AND HIGH SPEED STEEL



cut down the cost of the operation and raise the standard of the finished product, being scientifically made in the "Morse" way to successfully meet the exacting demands of skillful users.

Using "Morse" Tools Means Efficiency and Economy

Morse Twist Drill & Machine Co.

NEW BEDFORD, MASS.

Three Minutes' Grinding puts a new and stronger tang on the shank. It fits the lower slot in the socket.

What Do Your Twisted-Off Tangs Cost?

Keep account for a time of the new drills used to replace those thrown into the scrap heap because of twisted-off tangs, and you will see. These scrapped drills are all right in every other respect.

The "PERFECT" Double-Tang Locket

gives a simple, effective, and inexpensive means of eliminating this cost and putting the drills back in money-earning shape. **Write for Folder A.**

"HERCULES" High Speed Twist Drills

TOOLS OF QUALITY

W&B

BEAR THIS MARK

TOOLS OF QUALITY

W & B CO

BEAR THIS MARK

Just What the Name Implies—The Strongest Twist Drill

Adapted, therefore, for the heaviest drilling. Hercules Twist Drills are twisted HOT from High Speed Vanadium Steel; the original properties of the metal are fully retained, and the special process of tempering makes the completed drill extraordinarily tough and durable. No special sockets or chucks are required, and extra large taper shanks do away with tang troubles. In fact, from the selection of materials to the most minute detail of the manufacture of Hercules Twist Drills, the ends in view are STRENGTH, STAYING QUALITIES and the ABILITY TO HOLD AN EDGE.

Actual results will convince you—try them on some difficult job.

The "CYCLONE" High Speed Chain Hoist

It is not consistent with Scientific Management to equip your plant with Hoists whose friction loss is comparatively high and speed and efficiency comparatively low. Nor is it good business to keep such hoists in commission.

Its unique gyrating internal yoke gearing and its self-lubricating graphite bronze bushings cut down friction in the "CYCLONE" High Speed Chain Hoists and increase efficiency to such an extent that it lifts faster in proportion to hand chain pull and overhaul than does any other hoist made.

That is why you should investigate the "CYCLONE." We are prepared to prove our claims to your satisfaction and ultimate advantage.

Shall we ship you one on trial?

MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty

BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery —in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Steel Castings

One of the two largest steel castings ever made in Canada was cast by us. They were Y-pipe connections for a 10,500 H.P. water wheel. We made it for the John McDougall Caledonian Iron Works, and they were thoroughly satisfied.

Absolute Satisfaction is Guaranteed

JOLIETTE STEEL AND IRON FOUNDRY CO., LTD.

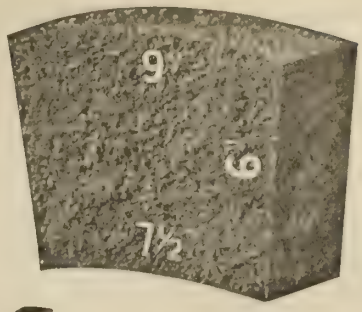
FIRE BRICK

AMERICAN and SCOTCH



CUPOLA BLOCKS and all other SPECIAL SHAPES

For Foundries, Blast Furnaces, Rolling Mills, Steel Plants, Cement and Lime Kilns, Glass Plants, Boiler Settings, etc.

IMMEDIATE SHIPMENTS
from our stock in Toronto, or direct from Works.

The Ontario Lime Association
LIMITED
118 Esplanade East, - TORONTO

FIRE BRICK *for* Cupolas

¶ The standard Fire Clays by which all other Clays are judged are those of Pennsylvania.

¶ They're the ones from which our Cupola Brick are made.

¶ The cost per thousand means nothing unless you know the results the Brick are giving.

¶ Write us for definite examples of how our material affects your melting costs.

HARBISON-WALKER REFRACTORIES COMPANY,
PITTSBURGH, PENNSYLVANIA

We Have Them **THE BEST GOODS FOR THE LEAST MONEY** You Want Them

HERE ARE THREE OF THEM

NO. 48 EAST INDIA PLUMBAGO

A quality of lead of uniform grade, high in fixed carbon. Guaranteed to slick, rub or brush on mold. It will not wash or run before the metal. Try a barrel on approval; we take it back if not satisfactory.

EUREKA BLACKING

We still insist that this blacking is the best core wash on the market. It will not rub off from the core; it will peel perfectly; it will not foam; and requires only clear water to prepare it. Order a trial bbl.

DETROIT CORE COMPOUND

A core compound adaptable for all cores, but more especially for brass. Imparts a hard surface and a soft centre. It is economical and satisfactory in every way. Help yourself to a barrel by writing us an order now.

A SOLIDLY BUILT GAP LATHE, clean working and strong at the gap. Of large capacity for work. Quickly adjusted. This tool is typical of McDougall fitness in factory equipment. It makes for quality in output and at low production cost.

DESCRIPTION.

Headstock construction prevents chattering, and deep oil chambers fitted with ring oilers make spindles and bearings self-oiling and always well lubricated.

Tailstock of a special type, and sleeve is clamped by a quick acting locking device. Tailstock is secured to bed by bolts adjusted from the top where they are easily accessible.

Bed, non-springing and webbed, and braced to secure rigidity.

Gap, vibration absolutely prevented by use of brace supports to carriage.

Spindle, high carbon hammered steel in solid chilled cast iron bearings, accurately fitted and self oiling.

Carriage and Apron, non-springing under severest strain, full "V" bearings and flat bearings in addition on front ways.

Double Back Gears give eighteen distinct spindle speeds, suiting lathe to work on widely different diameters.

Compound Rest, with graduated base, accurately fitted taper gibs, end adjusted. Screws in both rest and cross slide read to thousandths.

Friction, Safety Feeds, screw and rod feeds cannot be both engaged at the same time. Quick changes of 1¼, 2½ and 5 times thread being cut.

Gears and Racks, cut from solid and steel where necessary.

Screw Cutting, full range of commercial threads provided for.

Equipment, Compound rest, steady rest, follow rest, large and small face plates, wrenches, two-speed, friction countershaft furnished with each lathe.

Accuracy, Strength, Solidity, Wear. These are the paramount features behind all McDougall Machines. Made **to meet extreme demands.**

RAHN-LARMON LATHES

16, 18 and 20-INCH STUD LATHES.

These Lathes are fitted with Automatic Stop, allowing one operator to run several machines, and are therefore GREAT MONEY MAKERS in a shop where considerable straight turning work is required

Tailstock is of offset type and is provided with set-over screws for taper work.

Drop us a line and we will be pleased to furnish full particulars and prices on the 3-in-1 Lathe also built by the above people.

ESTIMATES CHEERFULLY GIVEN ON ALL CLASSES AND DESIGNS OF MACHINE TOOLS.

Send us drawings or samples of repetition work which your machines are not turning out fast enough and our expert will show you how this can be remedied, also giving guaranteed outputs.

A Rapid Manufacturing Machine

The Pratt & Whitney Turntable Lathe

More strongly constructed throughout than any other turret lathe on the market to-day, and yet with that accuracy essential to a Precision Turret Lathe, the Turntable Lathe has been found to be equally precise for light or heavy duty.

A large, spacious turntable, which when operating, is held in position by a rigid binder at the head side of the turntable, offers the strongest possible support for the turret tools. The turntable is cross-feeding, thus rendering possible an almost unlimited number of boring, turning and facing operations. The greatest rigidity is given the machine by an exceptionally heavy bed with broad bearing ways and a massive stationary head strongly bolted to bed. The head is entirely enclosed, with gears running partially submerged in oil. An easy running machine, preserves accuracy and ensures long life There are eight spindle speeds that can be changed while the machine is running, and variable longitudinal and transverse feeds for the turntable with numerous longitudinal and transverse stops which facilitate the most rapid work.

Many pieces can be machined in one cut, which renders possible an easy duplication for similar work—also especially convenient when turning tapers.

Equipped with a universal outfit of tools for either bar or chucking work

Write for full descriptive catalogue "Turntable Lathes."

Rapid Surface Reduction by Grinding

The P. & W. Vertical Surface Grinder

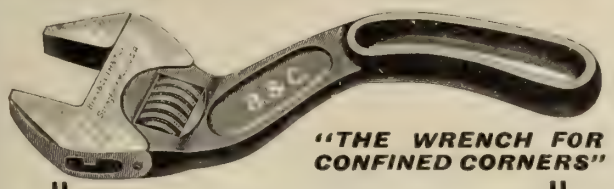
Equipped with rectangular or revolving circular magnetic chuck.

This machine works directly on rough or hardened castings or forgings and gives a mirror finish. It is much faster to face work by grinding than by milling or shaping, and an absolutely flat surface is the result.

Flat work of all kinds that has warped in the hardening process can be corrected by flat surface grinding.

The P. & W. Vertical Surface Grinders have many points in their favor that commend their use. A powerful drive—centralized control of levers and handles at the front of the machine—automatic oiling for table—the broad, cup-shaped wheel which covers the full width of work, thus ensuring absolute flatness—a unique spindle construction which preserves the accuracy of spindle alignment—adjustable automatic reversing mechanism for table—the method of holding the work by plain or magnetic chucks—revolving chuck, etc., etc. This is the fastest Surface Grinder made.

Send blue prints or samples of the work you are doing, for production estimates.



Write for full descriptive catalog, "Grinding Machines.

Cost Reducing Features

An indestructible spindle bearing made of hardened steel and cast iron.

A head construction that gives more effective pulling power at the spindle than any other lathe built.

A patent "compensating V" that permits four times the bearing area between the carriage and bed found on other lathes.

A carriage in which the tool thrust is taken on a bearing the entire length of the carriage, and which positively will not climb the V.

A double-walled one-piece apron which will last as long as the rest of the lathe.

A quick change gear complete in one unit, giving thirty-six changes with two operating levers.

An offset compound rest which can be used without skinning the operator's knuckles.

The centres set back of the middle of the bed, giving greater swing over carriage and permitting the turning of work up to the maximum swing without the tool overhanging the bed.

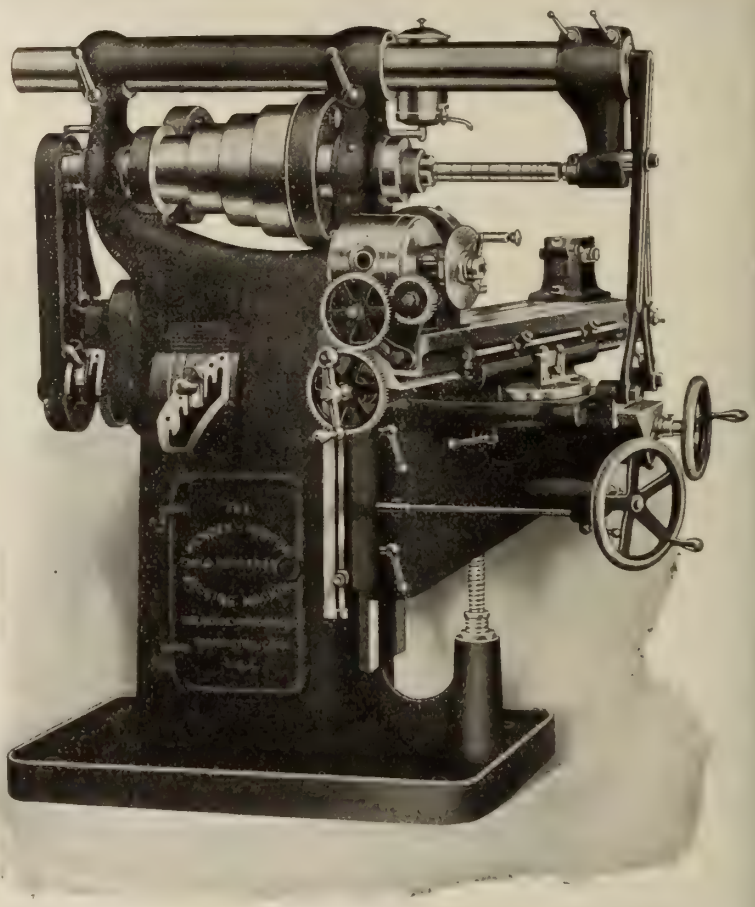
Think of the Advantage

of being able to take that grinding job to a machine equipped with drawback chucks. Every tool room and manufacturing plant have felt the necessity of a grinder of this kind. Those taper reamers, milling cutters, hollow mills, in fact, grinding of any kind, may be accomplished, through the use of the Hardinge Universal Grinder, without spending more time to set up the job than it takes to do it.



The Hardinge is a truly Universal Machine, and you should write us to-day for further information.

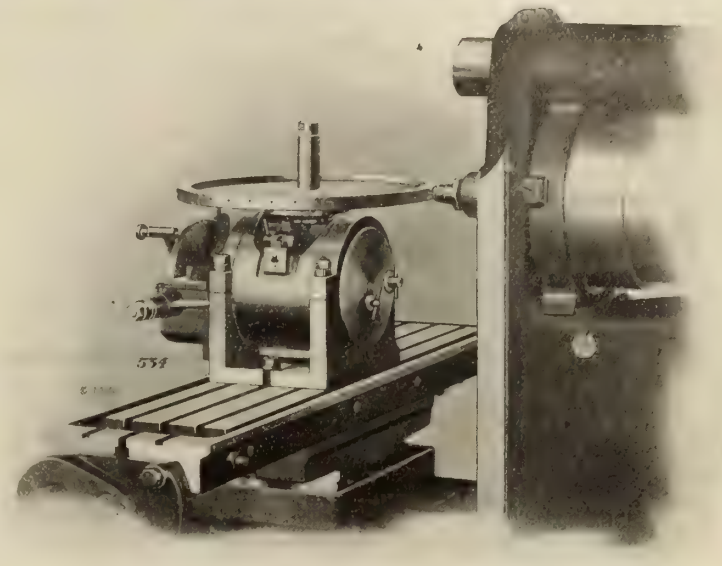
WILLIAMS TOOL CO.

Box 18 Erie, Pa., U. S. A.



The advertiser would like to know where you saw his advertisement—tell him.

CINCINNATI UNIVERSAL TOOL ROOM MILLERS

Thirty-six holes ¼-inch diameter are spaced on the periphery of a 19-inch disk rigidly held on a 12-inch Index Head. They are first drilled, then bored, a trifle under size, and finally reamed to a plug gauge fit with a specially ground ¼-inch end mill. The error between holes is less than one thousandth (—.001 inch.) To get such results requires a miller that is accurate all over.

This is a good illustration of the best method of handling work of larger diameter than the index centres will swing. The swivel trunnions on our Dividing Head are large in diameter and fully protected in all positions, insuring permanency of alignment at any angle to which the spindle may be set.

Cincinnati Millers are as famous for their accuracy as for their productive capacity.

Selling Agents for Canada—Canadian Fairbanks Co., Ltd., Montreal, Toronto, St. John, N.B., Winnipeg, Calgary, Vancouver

You pay for every minute of the machine's and the operator's time

But Only Productive Time Pays You

Productive time—
Wasted time—

The total time a machine is operating separates itself into these two parts.

The manufacturer pays for both.

But only productive time repays him.

The Bullard Vertical Turret Lathe is designed to give the greatest possible amount of productive time.

Wasted time is reduced to that point where it is only absolutely necessary time between operations.

To accomplish this there are a number of features:—

Vertical Construction makes chucking an easy matter.

Centralized Control saves unnecessary steps.

Quick Speed Change makes it easy to maintain proper cutting speed.

Rapid Power Traverse reduces the physical effort required.

Observation Stops reduce the time required for measuring to a minimum.

Two heads, a Turret Head and a Side Head, enable two or more tools to work simultaneouly—Multi-Cutting—and at the same time each head carries a series of tools in instant readiness for a sequence of operations.

These features combine to give the Vertical Turret lathe the greatest amount of productive time.

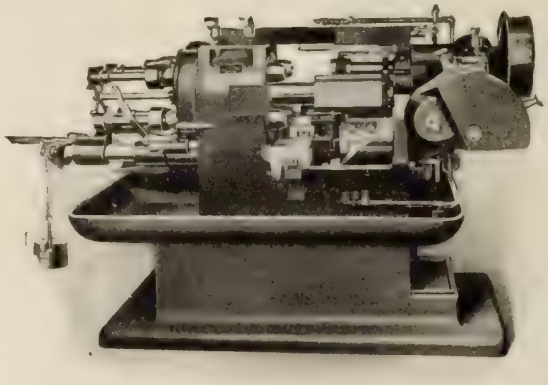
On all face plate work within its range, the costs are correspondingly lower.

Take it up with our Time Study Department.

WRITE FOR A COPY OF OUR TREATISE ON FACE PLATE WORK NO. C-15.

The Bullard Machine Tool Co.

BRIDGEPORT, CONN., U. S. A.



The Gridley Automatic Turret Lathe

Gives a Service That Is Entirely Different From That of Other Makes

and the manufacturer who takes advantage of this service is the man who will save money and increase his output.

The "GRIDLEY AUTOMATIC" handles work of greater length and of more complex character than any other machine of this kind.

Its construction is very simple, enabling one operator to run several machines at once, and to use tools tandem, thereby increasing production.

"GRIDLEY" SINGLE SPINDLE.
We also manufacture the Gridley Multiple Spindle Automatic.

The "GRIDLEY" is the only automatic that gets away from the old box tools and uses extra strong tools on the slide.

Every cut that the "GRIDLEY AUTOMATIC" makes is accurate, smooth and perfectly uniform from start to finish. If you are interested in machine shop economy, write us at once for catalog and prices.

Ryan, Manager.

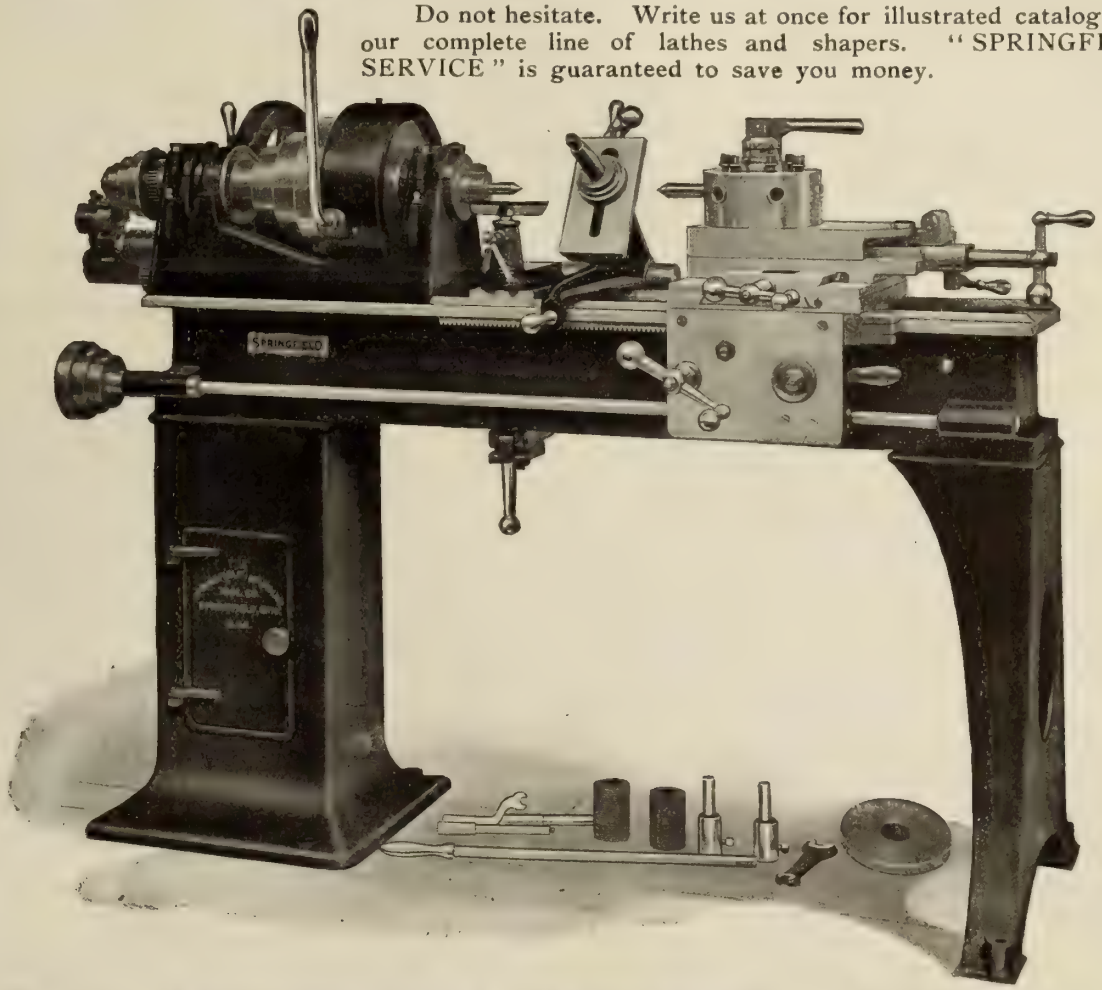
You Can Double Your Output If You Install a

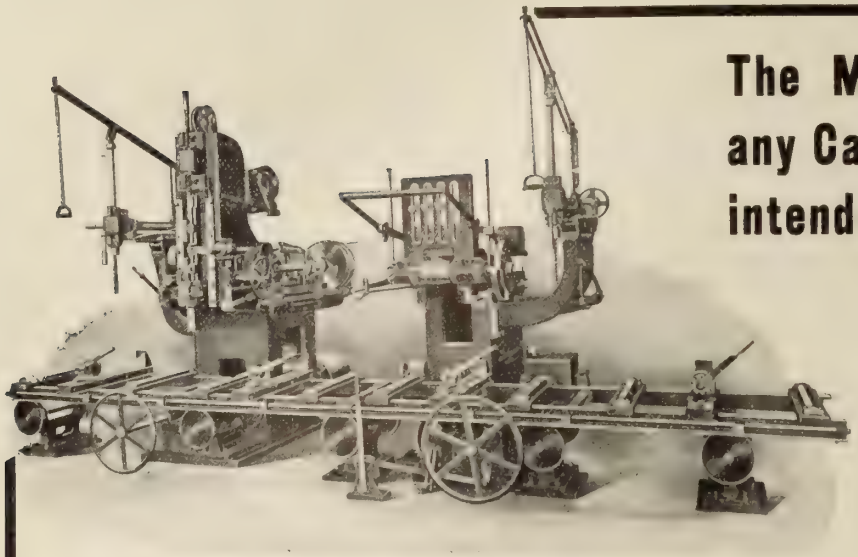


"SPRINGFIELD" Cabinet Turret Lathe

This is one of our latest productions and it contains several new features and improvements that ensure a maximum output at minimum cost. Its accuracy, speed and efficiency cannot be equalled.

The turret is so designed that one slight backward movement of the blades loosens the turret and at the same time withdraws the locking pin; a slight forward movement then produces the partial revolution of the turret for the next tool, and simultaneously locks and tightens it, the entire operation being done in a second or so by one hand.

This lathe is back geared, and has a four-step cone pulley of large diameter.



Do not hesitate. Write us at once for illustrated catalogue on our complete line of lathes and shapers. "SPRINGFIELD SERVICE" is guaranteed to save you money.

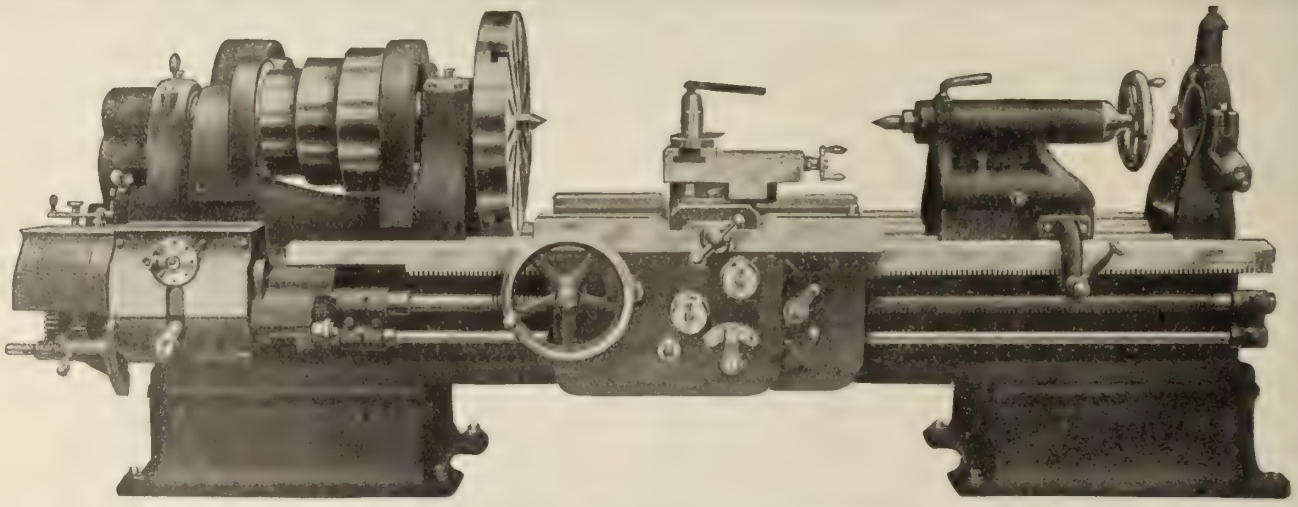
FAY & EGAN

Combination No. 214



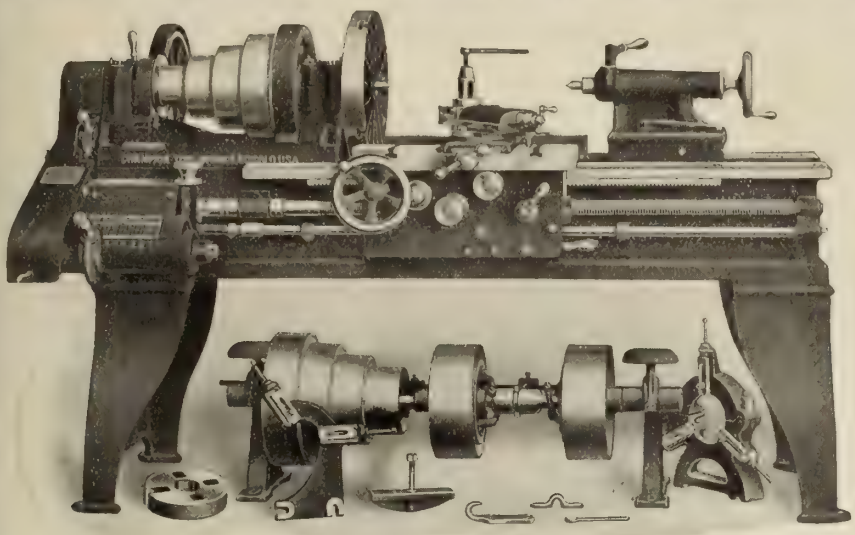
Vertical Hollow Chisel Mortiser and No. 150 Auto Car Gainer

With it you can Mortise, Bore and Gain the heaviest car timbers without moving them from one machine to another. When you consider the high quality of work and its economical production with this machine, you cannot fail to recognize its absolute necessity in a modern Car Shop.

OUR CAR SHOP CATALOG FREE TO INTERESTED RAILWAY MEN.

If you haven't a copy of it or of our No. 84 complete catalogue for handy reference, send us your name and address on a post card and they will be sent at once. Both will be valuable to you.

J. A. FAY & EGAN CO. 362-382 W. FRONT STREET, CINCINNATI, - OHIO.



26-inch Instantaneous Change Gear Engine Lathe

The headstock is of the double back geared type. **Maximum belt pull is transmitted to the cutting tool.** The double plate apron is of the most rigid construction possible. Tailstock provided with pawl to engage rack cast in bed. In every detail, this machine is strong, powerful and durable. It is the ideal tool for the modern machine shop, *Descriptive circulars on request.*

Schumacher & Boye

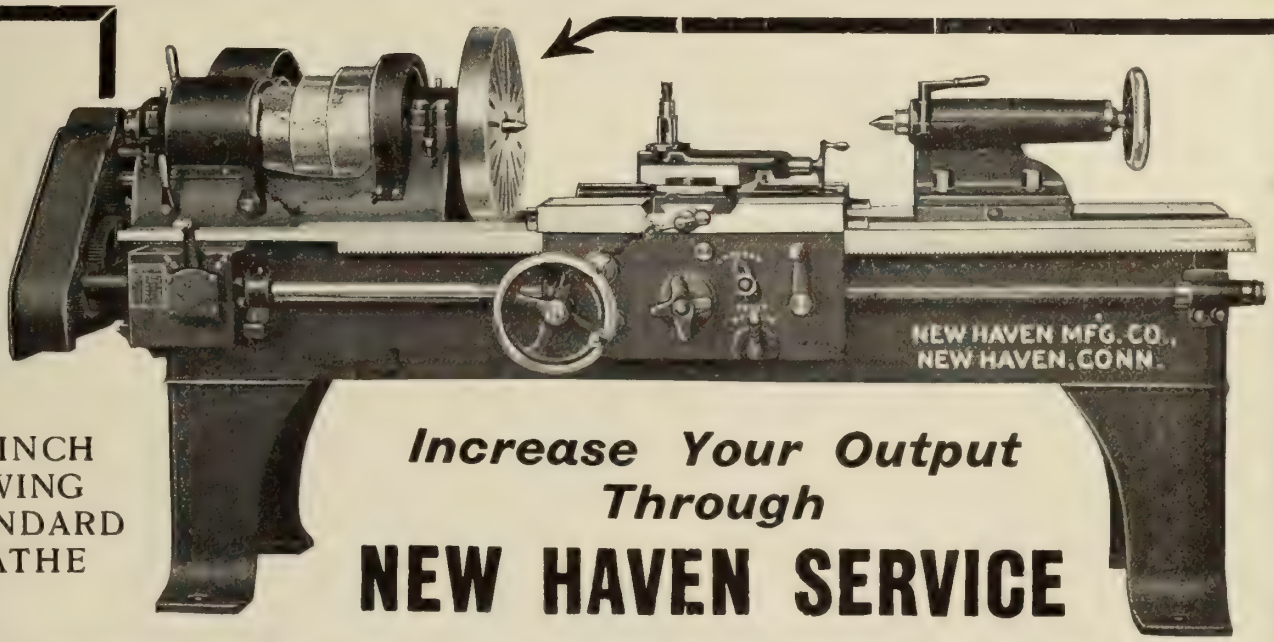
Engine Lathes **Cincinnati, Ohio, U.S.A.**

FACTS ABOUT CHAMPION LATHES WORTH CONSIDERING

16-in. Quick Change Lathe.

In comparing Lathe Design you should go beyond a few of the "Top Heavy" catchy points of extra dimensions for one or two parts of the machine and see if they are in keeping with the rest of the Lathe.

You won't have any particular need of a Large Spindle Bearing if it takes up so much Headstock space as to necessitate a small cone and consequent narrow belt.



Big and little dimensions don't work hand in hand.

What you need is a machine of **Well Balanced Design**, and you get it in the **CHAMPION**.

READ ABOUT IT IN OUR CATALOGUE OF 10, 12, 14, 16 and 18 IN. LATHES.

The Wheels Your Men Can Depend Upon

ALOXITE GRINDING WHEELS

When an Aloxite wheel is put on the arbor it stays there until worn out. No question about its work—fast, clean, cool-cutting every minute—no rasp or screech—cuts easily, quietly.

The man in the illustration is grinding lathe tools in a Philadelphia shop. He is using a 16-inch *Aloxite wheel.* Both he and his foreman say it is the best wheel they ever had in the place—holds its shape—never glazes—doesn't burn the tools.

Your men wouldn't ask for a better wheel—They couldn't get it. Let us help you get the right wheel in the right place.

Don't Wait Until To-morrow

to send in your request for full particulars regarding

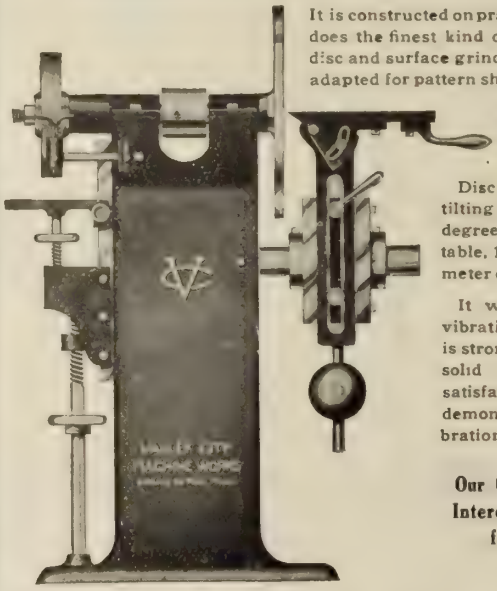
BLOUNT'S

Wet Tool Grinder

Do it at once, as the sooner you get acquainted with "Blount Service" the more money you will save.

This Wet Tool Grinder is an absolute necessity in every shop, as it puts a perfect edge on all tools being sharpened.

"BLOUNT'S" Grinder can be run continuously if desired, as it is fitted with self-oiling bearings and there is positively no wear of parts, because the propeller of the pumps, furnishing a constant supply of water, is loosely fitted and cannot touch the case at the nearest point. It has a sleeve cap that prevents leakage without the use of packings.



J. G. Blount Co.

EVERETT, MASS., U.S.A.

No. 9 Disc and Surface Grinder

Here is the Machine That will Meet ***Your*** Requirements.

It is constructed on practical lines and does the finest kind of work. This disc and surface grinder is especially adapted for pattern shops, die makers and all kinds of tool and surface grinding

Disc side has table tilting from 0 to 43 degrees. Size of disc table, 10 x 10 in. Diameter of disc, 18 in.

It will solve your vibration problem. It is strongly built of one solid casting; and satisfactory tests have demonstrated that vibration is avoided.

Our Catalogue will Interest You. Write for it now.

40% carbon steel shaft.
Grinding limit variation, .00025.
Stock removed, .015 on dia.
Two sizes ground.
Time, 7½ min.

Write us your problems and let us give you our production estimate.

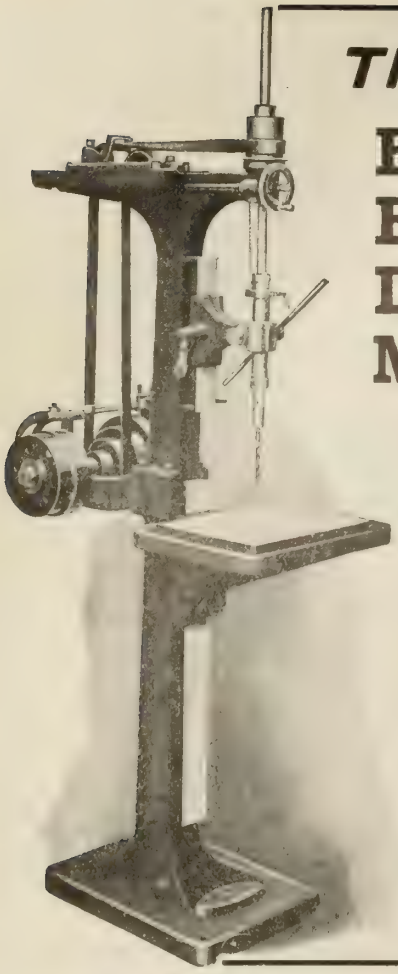
The Bath Grinder Company, Inc., Fitchburg, Mass., U.S.A.

What is Your Method of Grinding Thread Chasers?

You know that it is practically impossible to keep threading tools in shape or to regrind them satisfactorily by hand.

The Geometric Chaser or Die Grinder

touches up all Chasers of a set uniformly and keeps them in condition for accurate work.



The machine is adapted for grinding any make of thread Chaser, whether of a stock or special type, and is also equipped with a second grinding wheel for ordinary tool grinding.

In shops where much screw cutting is done, one of these machines will save its first cost in a short time in labor alone, and Chasers that are kept properly ground will last a great deal longer and do far better work than Chasers that are subjected to the hit-or-miss hand grinding.

Let us send you our Special Booklet describing this Chaser Grinder.

INEXCUSABLE

It is not necessary to have hot boxes or to be rebabbitting bearings every few months. The following letter is merely one among thousands. Why not insist upon having Magnolia: it will show a big saving all along the line.

Philadelphia, Pa., Jan. 2nd, 1911.

Dear Sirs:

I will tell you about the use I have put Magnolia to. I poured three bearings on Jack Shaft that were always hot and could not lay your hand on. I put Magnolia in, and the bearings are now running fine and are about 100 degrees warm—there was White Brass in them before. I poured a top bearing block on a 300 H.P. Corliss Engine that could never be kept cool: no more trouble. This was done five months ago. Four months I ago poured a main bearing on a 250 H.P. Griene Engine top, bottom and quarter blocks, started the engine up, it never got hot: Engine runs twenty-three hours a day. I had trouble with Motor bearings; had to fix them every couple of months, they had white brass in before, changed them all to Magnolia, have not had any trouble since. This was one year ago. I have used it on Crank pin bearings and find it fine. I hope this is good news for you.

Yours truly,

CHAS. E. REBER,
Foreman Machine Shop and Repairs, Camden Coke Co., Camden, N.Y.

A Few of the Lines We Manufacture

Make your power transmission an ***asset*** instead of a ***liability***—a money-saver instead of a power-waster. Belt your machinery with

GOODYEAR

Imperial

High-Speed Friction Surface

Belts

"The Belt That Clings"

Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded.

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre ***cotton fabric,*** rubberized, cured and vulcanized into one solid, enduring piece.

Earns Cost---Costs Less

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

Wears Longest Without Stretching

Most economical because it wears longest. First, because it doesn't slip. Secondly, because it is made by a process that abolishes ***internal friction.*** This soon wears the life out of best leather belting and is caused by internal ***grinding*** as the belt bends and whizzes around small high speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the ***stretch has all been taken out,*** rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed, friction-surface, wear-resisting belting.

We also make other rubber products—Tires, Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high quality materials, skillful workmanship and years of experience that have built such famous service into products of the Goodyear Tire & Rubber Co., Akron, Ohio, U.S.A. Write us at once.

Buffalo "B" Volume Exhausters

have a decided advantage over the usual type in the solid, one-piece peripheral shell.

Not only is this construction very rugged and strong, but the absence of joints under pressure in the shell prevents leakage of air and waste of power. The blast wheel is strongly built, accurately balanced, and, together with the extra long oil-ring bearings insures smooth, easy and quiet operation.

BUFFALO EXHAUSTERS are especially adapted for handling dust and refuse from emery and buffing wheels and tumbling barrels; and smoke, gases and fumes generally. You can always depend on efficient, reliable operation.

A wide range of sizes and capacities make it easy for you to select just the one for your requirements. Ask for catalog 178-LD and prices.

RENOLD PATENT SILENT CHAINS

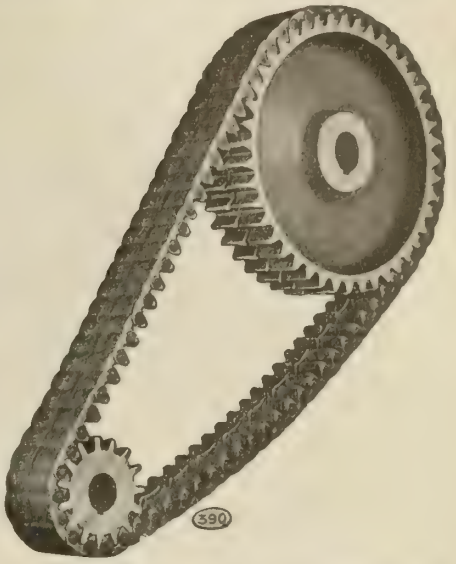
What Users Think

Montreal, Feb. 8, 1909

Messrs. Jones & Glassco, Montreal.

RE RENOLD SILENT CHAIN DRIVE.

GENTLEMEN,—In reply to your inquiry of Jan. 30th, I may say that the Renold Silent Chain Drives we have installed are giving every satisfaction.

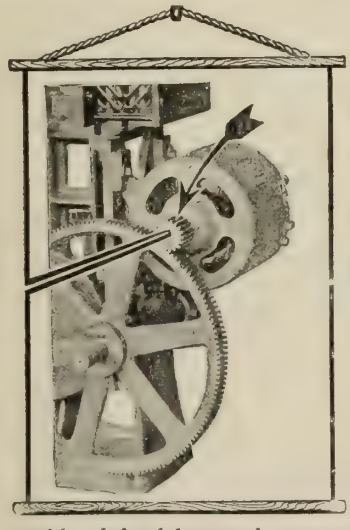


Our first drive was installed to replace a 12 in. belt which was giving us trouble on account of short centres: this chain has run continuously for four years without the slightest trouble.

Our second drive was installed on a mixing machine doing heavy duty and which had previously broken up two sets of spur gearing, this chain has run over three years with no sign of wear yet.

Our third drive was installed on a calendering machine after breaking two sets of helical gears, and this has been so successful that we are now installing two more similar drives.

I would be perfectly willing to make an appointment with any person genuinely interested and show him the drive in operation.



The above comes from one of the largest manufacturers in Montreal and is signed by the Mechanical Superintendent. Up to the present (1911) these drives have not received repairs of any kind.

Write for Catalogue

So satisfactory has their experience been that they are ordering (for a new extension) Renold Chain Drives throughout.

Jones & Glassco Sole Canadian Agents **Montreal**

"You must not neglect Vibration and Silence in Gear Drives."

That is about the way a college professor would talk to you about noisy gears. An experienced shop manager would add that outside of the delays and expense for renewing gears that have stripped because of vibration, the noise of high speed metal to metal gears is also expensive in misunderstandings and in creating bad feeling among the workmen.

If you have doubts, put one New Process Pinion where the noise and vibration are worst. We know that the results will make you want more of these noiseless pinions. Ask for our new catalog.

PUMPS

The superior excellence and splendid results shown by

"FAIRBANKS-MORSE"

pumping machinery are largely due to the fact that for many years we have manufactured Hydraulic Machinery of all descriptions. We are therefore able to build pumps which are properly designed and adapted to every-day use. This is of the greatest importance in a first-class pump, for the usefulness of an engine may be lost if the pumping machine is badly designed.

You will get all these important features when you purchase a "FAIRBANKS-MORSE" pump.

Let us solve your pump problems.

The Collingwood Shipbuilding and Engineering Co., Ltd.

By Bellfield (J.H.W.)

Being an Illustrated Description of the Plant and Products of One of Canada's Leading Shipbuilding and Marine Engineering Establishments, and Serving to Show The Ample Provision Made for the Furnishing, Upkeep and Development of the Marine Transportation Interests of This Dominion.

THE Collingwood Shipbuilding & Engineering Company's plant and property covers an area of about 40 acres, and embraces 2,000 feet of water front. In addition to the building of steel and wooden vessels of every type and size and their machinery equipment, the most up-to-date appliances and facilities are available for rapid, efficient repair work, by day or night.

Capacity of Plant.

There are two dry docks. No. 1 is 525 feet long by 78 feet wide, while No 2 is 450 feet long by 105 feet wide; the depth of water in each being 16 feet 6 inches over the sills. Four fairly large vessels can be laid down at once. Thus, on the east side of No. 1 dry dock, there is a 500-foot building berth served by overhead electric traveler, running on a gantry; while on the west side there is a 460-foot building berth served by locomotive crane and spar derrick booms. Again, on the east side of No. 2 dock is located a 400-foot berth, served by spar derrick booms and crane. On the west side of this dock, the largest ships are built, the berth being 600 feet long, and served by electric traveler on a gantry, similar to that on the east side of No. 1. Both gantries were built by the company themselves, as were also the overhead travelers, with the exception of motors, controllers, and other electrical details. The capacity of the travelers is nominally 20 tons, although they have often lifted considerably heavier loads.

The legs, or columns of the gantry, on the side next the dock, are of light lattice work construction, carrying a single rail on top. On the other side of the building berth, the columns are in pairs, and support two rails, so that the traveler runs on three of these, as may be seen in the illustration showing two scows ready for launching. This cut is introduced chiefly because it serves admirably to demonstrate the method of launching adopted, not only for scows but for all ships built in this yard. The overhead traveler is fitted, at its outer foot, with a jib, by means of which the outer running rail is removed piecemeal, together with the supporting columns. The vessels are then side-launched into the dock.

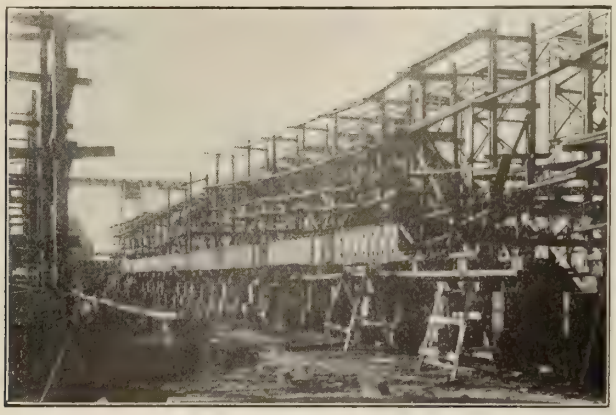
Both docks are closed by massive wooden gates, fitted with the usual sluices. The gate of No. 2 dock, is probably the largest wooden gate in Canada, its dimensions being 97 feet 6 inches long at the top, 87 feet 6 inches long at the bottom, and 16 feet thick at the centre.

Ship Construction Equipment.

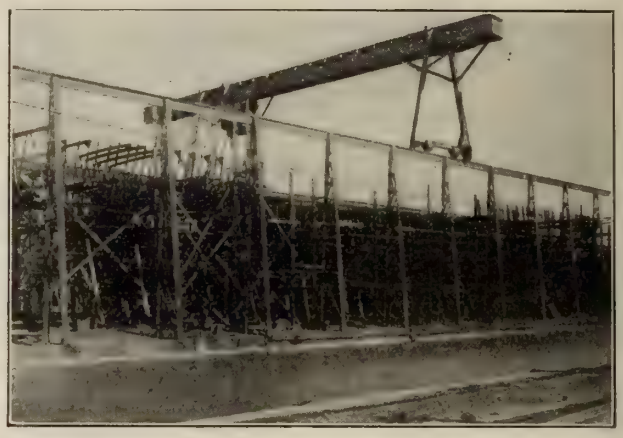
Adjacent to No. 1 building slip is the punch shed, the equipment of which includes shears, punches, and radial drills by Bertram, MacGregor-Gourlay, Long and Allstater, and a 22-foot edge planer, by the Hilles & Jones Co., Wilmington, Del. Here all ship plates are sheared to size and punched, after being marked from the wooden templates prepared in the mold loft, which is located above the punch shed. This building is 220 feet long by 50 feet wide.

At the end of No. 1 slip are located the rolls for bending and flanging ship plates. These are of massive construction, and consist of three rolls, 18 inches diameter by 18 feet long, driven through a positive clutch by a two-cylinder 9 by 12-inch steam engine. The top roll is raised or lowered, to suit different thickness of plate, by means of vertical screws operating through bevel gears by friction drive from the engine. For

SHIPYARD, DRYDOCKS AND TOWN OF COLLINGWOOD FROM THE HARBOR



flanging plates the lower back roll is provided with a slot. The rolls were built by Wickes Bros., Saginaw, Mich.



Near the south end of No. 1 building berth, there is located a stationary 7-foot gap riveter for riveting ship frames; this is operated by steam, and handles more rivets per hour than is possible with a hydraulic riveter.

To the east of the punch shed is the stock yard, where plates, channels, angles, etc., are stored. When the weather permits, a good deal of marking-off is done here, so as to conserve space in the punch shed. The yard is served by an electric traveling crane.

All plates intended for salt water trading vessels, are first pickled in a tank containing dilute muriatic acid, in order to remove the blue scale caused by rolling. It is a well-known fact that salt water rapidly dislodges paint, no matter how carefully applied to a plate not previously pickled.

The blacksmith's shop, covering a space 120 feet by 50 feet, and situated on the east side of the stock yard, is equipped with eight fires and a 2,500 pounds steam hammer. An Ajax rivet making machine is kept busy producing ship rivets. Here are also located the furnace and large slab where frames, angles, etc., are bent to the required curves and other shapes. Heavy forging, such as tail-shafts, connecting rods, etc., are purchased from forges making a specialty of that class of work. This of course is usual practice with marine engine builders. North of the blacksmith's shop, is a small boiler and dry kiln; the latter is used for drying timber, while the boiler supplies steam to the gap riveter and also to the engine driving the plate rolls,—already mentioned. A two-storey wooden building 125 feet long by 30 feet wide, is utilized on its upper floor as a patternshop, and at first glance on entering, we were surprised to note the entire absence of wood-working machinery. Enquiry brought the information, however, that

the plant of the joiner's shop on the lower floor did service for the pattern-makers. Very few joiners are now employed on the plant,—in fact the joiner shop is practically idle, owing to the interior wood work and decoration on

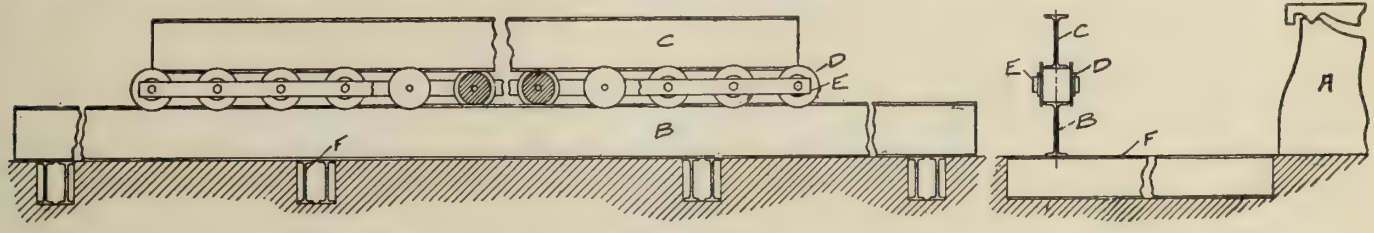
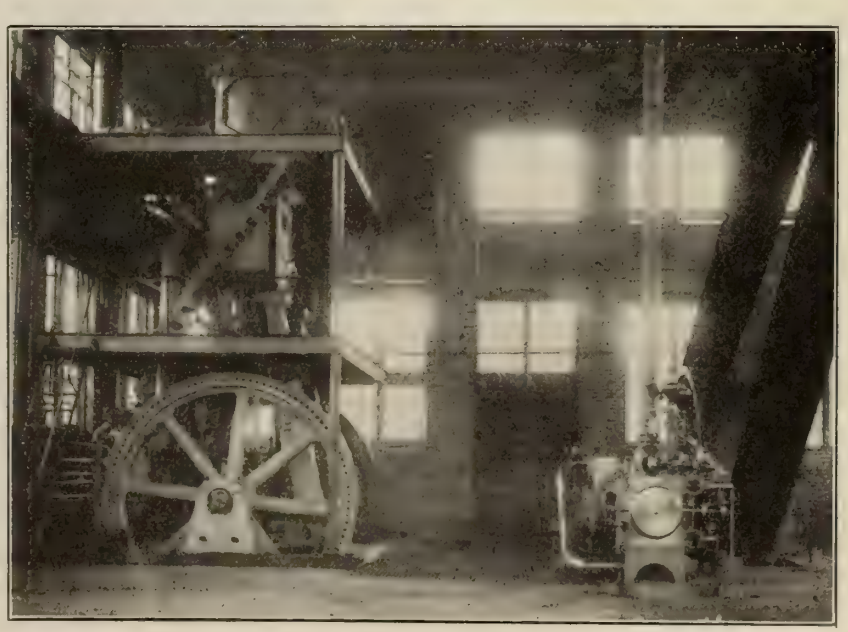
Launch of the Ontario & Quebec Navigation Co. Steamer "Geronia," at the Collingwood Shipyard.

all vessels built here having been transferred to the Brynes Mfg. Co., Collingwood. This concern is controlled by the C.S.B. Co.



The Power House.

Situated halfway between the two dry docks is the power house, a large new brick building with steel roof trusses. The floor space, 100 feet long by 45 feet wide, affords ample space for additional equipment in the future. At present, the power is furnished by a horizontal tandem compound Corliss engine built by the John Inglis Co., Toronto. The cylinders are 18 and 34 inches diameter by 36 inches stroke. The engine exhausts to a Northey independent pump condenser situated in a chamber below the power house floor. The engine has a 14 foot pulley and drives a countershaft by means of a 32 inch belt. From the countershaft two Canadian General Electric d.c. generators are driven, each having a nominal capacity of 85 k.w. These are at present considerably overloaded and it is intended to duplicate them in the near future and instal another engine.



Perhaps the most conspicuous feature in the power house is the air compressor. As in every other shipbuilding yard, a very large number of air-motors, and chipping, riveting and caulking hammers are used. To supply air for these, the Collingwood Shipbuilding Co. designed and built the compressor seen on the left in our illustration of the power house. As will be noticed, the machine is of the vertical type and presents very much the same appearance as a 2-crank compound marine engine with the link motion removed, and two fly-wheels and governor added. The diameters of the steam cylinders are 18 and 36 inches, while the compressor cylinders, placed above, are 18 and 31 inches diameter. The common stroke is 36 inches. Each of the two crossheads drives a pump, one being the jet condenser air pump. The other supplies the condenser injection water and also circulates the cooling water through the jackets of the compressor cylinders.

The air, of course, is compressed in two stages, and on its way from the low pressure to the high pressure cylinder, passes through the intercooler seen against the wall behind the steam cylinders. The capacity of the compressor is 1,200 cubic feet of free air per minute. The Corliss engine and compressor are painted white and have as a consequence a clean and well cared for appearance. Steam is supplied from the pump and boiler house, situated a few yards away at the entrance to No. 1 dry dock. Here, are two Scotch dry-back boilers working at 130 lbs. pressure, one of them being 11 and the other 8 feet 6 inches diameter. Additional boilers will be installed when the second engine is put down in the power house.

The pump for emptying the docks is

Planer Extension Rig in Machine Shop of The Collingwood Shipbuilding Co.

Air Compressor and Horz. Corliss Engine, New Power House, Collingwood Shipbuilding Co.

located in a room adjacent to the boiler house. It is of the centrifugal type and has two 30-inch suction pipes connected to a main leading from each dock; the discharge being delivered into the lake through a 40-inch pipe. The pump, driven at 160 r.p.m. by a direct connected inverted vertical engine with cylinder 22 inches diameter by 24 inches stroke, is capable of emptying either dock in about an hour and a half. Two small (12-inch) centrifugal pumps serve to keep down any water that may drain in thereafter, and are run for half an hour or so when required.

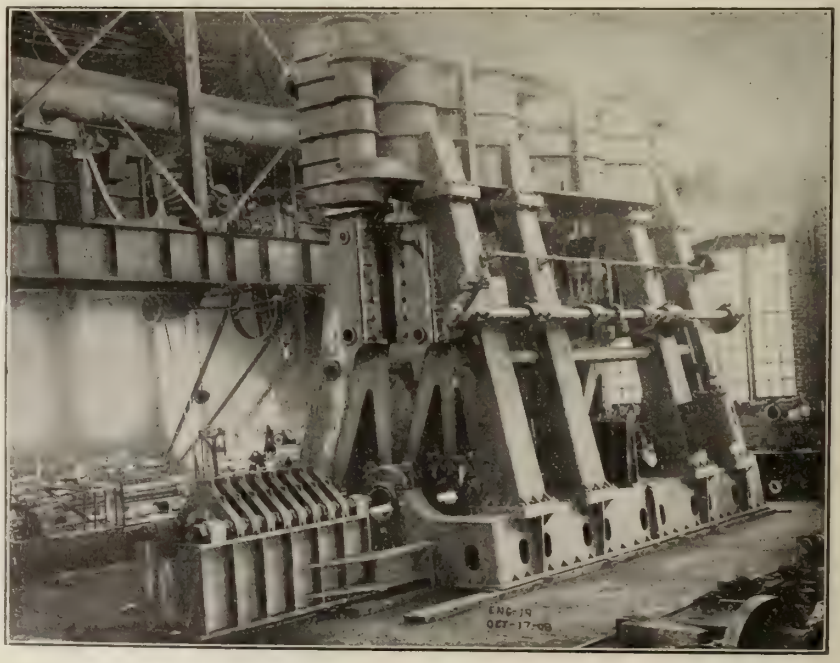
Machine and Erecting Shop, Collingwood Shipbuilding Co.

The Boiler and Machine Shops.

The boiler shop is a well-lighted building of three bays. It is 80 feet long by 120 feet wide. Each of the two sides bays has a gallery above; that on the north side carrying the heating and ventilating apparatus supplied by the Buffalo Forge Co., while the other is used for laying out light plate work. The main bay is served by a 3-motor electric traveler of 50 tons capacity. This was built by the Collingwood Shipbuilding Co., as were also the cranes in the machine shop and foundry. The motors, controllers, etc., were purchased from and are of the Northern Electric Co.'s make. When the shops were built, the columns and crane runways were designed for a crane load of 100 tons with a view to increased capacity if necessary in the future.

The boiler shop forms a good example of what can be done by systematic management in the way of handling heavy work in a small space. To an outsider two large Scotch boilers seem to comfortably fill the main bay! Yet the men do not seem inconvenienced at all; work goes on steadily all day and the boilers are always out on time. The vertical boiler plate rolls were built by Wickes Bros., Saginaw, Mich., and will take in a plate 12 feet wide. Driven by a two-cylinder horizontal steam engine, they are capable of bending plates up to 2 inches thickness.

The hydraulic riveter has a gap of 10 feet 6 inches and can has a gap of 10 feet 6 inches and can close rivets with a force of 160 tons,—the working pressure being 2,000 pounds per square inch. With the exception of the riveting head, which was purchased from the Chambersburg Engineering Co., Chambersburg, Pa., the riveter together with the accumulator which serves it, was built by the Collingwood Shipbuilding Co. This latter has two 9-inch rams, and is loaded by a solid monolith of concrete, instead of the usual tank filled with scrap iron. The pumps are of the 3-throw belt driven type made by the Northey Mfg. Co.



The boiler is suspended for riveting from an overhead crane operated by hydraulic pressure. The carriage has longitudinal and traverse motion, and is controlled from the floor by suitable levers.

The principal machine tools in the boiler shop are a 19ft. plate edge planer and a large radial drill both by the John Bertram & Sons' Co. At present all flanging is done by hand, but the old power house, which lies alongside the boiler shop, is about to be converted into a flanging shop and will be fully equipped with furnace and hydraulic flanging press.

The Foundry and Machine Shop.

The foundry and machine shop are under one roof, in a building cut off from the rest of the plant by the Grand Trunk tracks. Each section is 80 feet long by 118 feet wide and is served by a 50-ton electric traveler similar to that already described in connection with the boiler shop.

The foundry presents no special features, except perhaps that it is rather better lighted than usual. There are two gallerys, one for pattern storage and the other forming the cupola charging platform, in addition to being used for storage of sea coal, coke, etc. The cupola is a No. 5 Whiting, and blast is supplied by a Buffalo Forge Co. No. 10 fan driven by motor. The two coke-

6,000 I.H.P. Triple Expansion Engine and Thrust Block, S.S. "Hamonic," built by The Collingwood Shipbuilding Co.

fired core ovens are located below the south gallery, close to the core-makers' benches. Molds are made in green sand, dry sand or loam, according to the size and nature of the job. A few brass castings are made, the brass being melted in the usual manner, in crucibles over a pit fire burning coke. The output of grey iron castings is about 50 tons per week with the foundry busy.

The machine shop is divided off from the foundry by a partition and sliding doors. These had not been completed at the time our photograph was taken. All the machines are painted white, while the shop columns and girders are a light grey, so that the shop presents a very bright, attractive appearance, concerning which, our illustration fails to do justice.

All planing is done on an open-sided planer made by the Detrick, Harvey Machine Co., Baltimore, Md. This has a table 16 feet long by 42 inches wide. Long articles, which have to be planed on the ends, such as engine columns, overhang the planer sideways to such an extent that there is a tendency for the table to tilt. This trouble has been overcome in the manner shown in the line cut. A is the planer, B and C are two 10-inch I-beams, the former being the length of the planer bed and the latter the length of the table. Between the two beams are cast-iron rollers D. These have a flange each side to keep them on the beams and are coupled together by side straps E. The I-beams, F, are 10 feet long, and are embedded in the floor. The beam B may be moved sideways along the beams F, to which it is bolted when in the desired position. The job to be planed is bolted to the planer table, and the overhanging end is bolted to the beam C. The top of C is slightly lower than the table, so that the work can be packed up square and true.

Arrangement of Machine Tools.

All the lighter machines are grouped under the two galleries and are served by chain blocks running on overhead rails. The heavy machines stand on each side of the main bay just far enough out from the galleries to allow the electric traveler to serve them. The heavy machinery on the north side of the shop, includes, besides the above mentioned planer, a 42-inch lathe with 18 feet bed, made by the London Machine Tool Co., Hamilton. This lathe handles pistons, cylinder and valve-chest covers, also tail and crank shafts, if not too big. Under this gallery are two 20-inch and one 18-inch engine lathe by Flather & Co., Nashua, N.H., and one 24-inch engine lathe by Betrams. There is also a double-headed bolt cutter by the Reliance Machine Co., Cleveland. The lathe, on which the heaviest work is done, was supplied by the American Tool Works Co., Cincinnati. A few years ago, its centres were raised and its face plate enlarged to swing 84 inches. Its bed is 25 feet long and will take a 24-foot shaft. A 16-inch slotter and a 6-foot radial drill, both by Bertrams, complete the list of heavy machines.

Under the south gallery, a 25-inch double shaper by Chas. Booth, Liverpool, is still doing good work though of distinctly old-fashioned design. Here also is located a group of six engine lathes, all by the Flather Co., and ranging from 14 inches to 24 inches swing. The two galleries are at present used for pattern storage purposes, but afford plenty of space for light machine tools whenever it may become necessary to increase the capacity of the shop.

The engines are erected and tested in the main bay of the shop. The bedplates on coming in from the foundry are placed on the floor and have the bearings bored by a 20-foot boring bar driven by an ordinary air-motor. They are then taken to the planer to have the facings for columns, etc., planed, after which erection of the columns takes place. The cylinders are first bored on the big lathe and are then transferred to the surface table to be marked off. They next pass to the planer after which they are set up on the engine to have the column bolts marked off. These bolt holes are then drilled at the Bertram radial drill. It will be noted that a considerable amount of heavy lifting is necessary, and the overhead traveler, in consequence, is kept busy.

In building cranks, the webs are first bored out and finished all over; then the crank pins are also finish-turned, and shrunk into the webs. The shafts are turned to a shrink fit on those parts fitting into the crank webs and rough turned elsewhere. After shrinking into the webs, dowel pins are fitted and a finishing cut taken in the lathe.

Work in Hand.

The firm is at present building a ship to the order of the Department of Marine and Fisheries, Ottawa, for lighthouse and buoy service along the Pacific coast. She is of open hearth steel, 215 feet long overall, 200 feet between perpendiculars, 38 feet beam and 17½ feet deep. She will be propelled by twin screws, driven by vertical triple expansion engines having cylinders 15, 25 and 42 inches diameter, by 26 inches stroke. Steam will be supplied by two Scotch boilers 14 feet in diameter by 11 feet long, working at 180 pounds pressure. The ship is being built to the highest classification at Lloyds and to Canadian Government special inspection. The hull, machinery, and boilers were all designed by the company. The ship will be named "Estevan," and will leave Collingwood next spring on her long voyage round Cape Horn to Victoria, B.C.

Number of Men Employed.

There are two drawing offices, one devoted to hull designing and the other to engine and boiler work. Fifteen draughtsmen are employed and the accounting department keeps busy a clerical staff of ten. The shops and yard gives employment to about 700 men, the number of course varying with the amount of work on hand.

S.S. Emperor.

The bulk freighter "Emperor," which recently came to grief in the Soo canal, was built by the Collingwood Co. She is the largest Canadian boat on the Great Lakes, and is owned by the Inland Lines, Ltd, Midland, Ont. Her principal dimensions are, length overall 525 feet; length between perpendiculars, 505 feet; beam, 56 feet; depth, 31 feet. Her single screw is driven by a 3-crank triple expansion engine having cylinders, 23, 38½, 63 inches diameter by 42 inches stroke. Steam is supplied by two Scotch marine boilers, 15 feet 6 inches diameter by 12 feet long. Each boiler has three furnaces and the working pressure is 180 pounds per square inch.

Officials of the Company.

President.—Captain Alexander MacDougal, Duluth.

Vice-Pres.—Thomas Long, Toronto.

Secretary-Treasurer.—Sandford Lindsay, Collingwood.

Directors.—P. M. Campbell, Collingwood; M. P. Byrnes, Collingwood; Simon Dyment, Barrie; H. B. Smith, Owen Sound.

General Manager.—Jas. M. Smith, Collingwood.

Our thanks are due to the last named gentleman for the facilities afforded us for collecting the material for this article on the occasion of a recent visit to Collingwood.

It has been found difficult to make large steel gears out of steel castings on account of the difficulty of getting a perfectly sound casting. One machine tool builder in the Middle West, has, therefore, abandoned the use of steel castings for large gears, and instead shrinks a forged steel ring onto a cast-iron gear body, much in the same way as tires are shrunk onto car wheel centers. Very satisfactory results are obtained in this way.

Some Features to be Noted in Efficient Shop Operation*

By E. T. Spidy **

The Writer of This Paper Occupies the Unique Position of Being the Youngest Member of the Western Railway Club to Read a Paper Before That Body, and It Speaks Much for the Evident Interest Being Taken in Present Day Questions Relative to Increased Efficiency in Manufacturing by the Rising Generation That Such a High Quality and Instructive Article Has Been Made Available.

IN this paper, I propose to bring out some of the many points that go to make an efficiently operated shop, and to make a few notes on each. Not so very long ago, shop efficiency was considered part of the foreman's duties, and, mainly due to the demand for increased output, the "Shop Engineer" is now a recognized necessity to relieve him of that part of his former work, relating to machinery upkeep, tools and general improvements. The foreman is the man on whom the responsibility of the individual shop rests; he is the "hub," as it were, and the smooth working of all the minor wheels deuends on his ability as an organizer, and on the amount of co-operative effort he receives.

Shop Organization Specialists.

The first point to which I would draw attention, is the "Shop Organization." By this, I mean the plan of control by means of which the whole work of a plant is divided and sub-divided among foremen and charge hands, so that the responsibility for any particular detail can be instantly located. The organization of any shop being governed by its size, the class of work handled, and the conditions met with, peculiar to itself, obviously no definite rules can be laid down. A shop may be organized to spesialize as much as possible, or specializing might be impracticable. For example, take a locomotive erecting shop; in one shop we see that the gang boss has the entire erecting of an engine to look after, from stripping to finishing, while in another shop we see the charge-hand concerned with the general erecting alone. A special gang strips the engine, another gang is responsible for shoe and wedge work, another for motion, and so on; the whole work being in the hands of men who are specialists at their particular work. In a small shop, the amount of specializing that can be done on these lines is minimized, but even here, we see that a certain man always does the same job on an engine, and is, in consequence, a specialist.

Shop Organization—Function of Foreman.

In manufacturing shops operated on a modern piece-work or bonus system, the introduction of functional foremen has proved successful. These latter are additional, and are responsible for certain functions of the shop that can be better handled by men who are experts, than by the regular foremen. In a piecework shop, specializing becomes a necessity, and enables the keeping of more accurate records. By dividing the work thus, each man becomes independent of the rest, for he alone gets all the benefit of his increased efforts, whereas, when the whole gang work together, the slow men have to be carried, and this causes oftentimes dissatisfaction.

Shop Organization—Standardization.

One point to which I would make special reference, is that of "standardization." Just how far this should be carried in a shop is hard to say, yet, being one of the items that reduces cost, it is well worth considering. Hand and machine tools should be standardized as far as possible, as should also be the method of dealing with them. All tools required should be handed to the men from a distributing room, situated as near the centre of the shop as possible Machine tools should be forged in the smith-shop and taken to the tool room where they are ground ready for hardening. The tool room itself should be equipped with a hardening furnace for machine tools, and an oven for hardening taps, dies, reamers, etc., that require careful treatment.

Tools, such as taps, reamers, jigs, etc., should all be checked against the man receiving same. A system of giving each man so many checks when he enters the service and making him deliver one check for each tool received, keeps a tab on all tools, and by placing that check where the tool came from, location is simplified, should the tool be wanted by anyone else. All tools should be called in periodically, and their condition observed, so as to keep the stock up-to-date.

Pneumatic tools should be brought in regularly for inspection and oiling, and suspended in benzine, which will tend to clean them.

Machine tools should, as previously stated, be ground in the tool department by a man kept especially for the job. Lathe tools have a definite shape, and all angles of lip and clearance are fixed to a standard. For roughing tools, the clearance angle, or angle behind the cutting edge, is 6 degrees, although some English standards reduce on this a little.

These angles are accepted standards, and represent results obtained by experiment and modern practice on heavy duty machines. Boring mills do not take tools of like height as lathes, and the back and side slopes are usually reduced a few degrees. Planer tools, again, reduce on the clearance angle, and have two degrees only. This gives a stiffness behind the point, supports it on entering the metal, and reduces the tendency to chatter.

All tools used on machines, whether roughing, finishing, knife or parting tools, can be handled better by a separate department such as the tool room, than by individual workmen. The reason for the many shapes of tools found in a shop, unsystematically handled, is that instead of being the result of each man's "experience," it is merely the result of "custom," the difference being quite obvious. The same remark applies to the tool smith. It used to be bad policy to fall out with the man who hardened your tools, and anybody, who has ever worked under these conditions, knows why. As the smith becomes fully acquainted with the methods of treating the many different kinds of steel now in use, it is reasonable to expect that if he does his work in bunches at a time, instead of one of this and one of that, while somebody waits, he will turn out more and better work, and get more satisfaction from it as well.

Driving wheel lathe tools, although all specially shaped, should, however, go through the same process in handling. Considerable saving is claimed at the Montreal Locomotive Works, on large finishing tools, by welding a piece of high-speed steel into a billet steel shank; the cost of such tools being small, compared with solid high-speed tools of the necessary heavy section, I might say that the same process was tried at the Canadian Pacific Railroad Shops in Montreal, but whether due to the hard tires, or otherwise, I understand the success met with was not convincing enough for its adoption as a standard. Some smaller special tools, however, are

---

* Paper read before the Western Railway Club, October, 1911.

** Assistant to general locomotive foreman, C. P. Ry. shops, Winnipeg.

high-speed-steel tipped right along. High-speed steel for tools used only occasionally, represents capital tied up, and if you can use your odd ends to tip special tools, you are certainly getting better interest on your outlay.

While on the subject of machine tools, the question of standardization of tool steel comes up. This is a difficult matter to decide, especially as each steel-maker claims his is the best. No one wants inferior tool steel, therefore, they let us experiment with our own particular class of materials, and determine what suits best. Although it may be impossible to adopt a standard steel for all work, I believe it can be done so far that certain tool steels will be found better on certain classes of material. High-speed steel forms a large expenditure item that makes this very desirable.

Feeds for Drills.

Feeds for drills vary with the metal drilled. For medium cast iron, a basis for a high-speed drill might be .01 inch per revolution, per inch diameter of drill: this, however, can only be considered a guide. Records, made at the Master Mechanics' Convention, this year, in Atlantic City, show that feeds of one-tenth of an inch per revolution at 575 r.p.m. were obtained in cast iron billets with an 1¼ inch drill removing metal at the rate 70.55 cub. ins. per min. This of course is phenomenal and was made under ideal conditions.

Cutting speeds on lathes, boring mills, etc., have also increased, and tend to increase with each improvement in tool steels. It is impossible to do more than make an average statement of what speeds should be used on various metals, owing to the many variable elements to be considered. The size of the tool and the quality of the tool steel, the capacity of the machine, the material operated on, the depth of cut taken and the feed employed all influence the cutting speed.

It must be granted that there are certain combinations of these elements better suited to each job than others, but to determine the correct combination to remove a certain amount of stock in the most efficient manner, necessitates a detail study of the machine from a power standpoint, and also an intimate knowledge of each condition to be met. It is considered best practice to remove the necessary metal in one or two cuts, according to the amount to be removed, and to use the heaviest feed practicable in connection with available speeds. The size of the tool is determined in some degree by the machine, and in experimenting with tools up to 1¼ inches width, they should be figured to stand 30 minutes maximum cutting before showing signs of failure. Careful experiment will afford much information of the relations between these elements, and will give some accurate idea of what can be expected from each tool. Modern lathes, with 6 inches centres, require 5 h.p. to drive, while a 24 inches centre lathe needs 30 to 40 h.p. to keep going; the latter power being necessary with two tools in operation.

Stroke Machine Speeds.

Stroke machine speeds have risen in line with other machines. Modern high-speed planers have cutting speeds from 30 to 90 ft. per minute, with return speed of 200 ft. per minute. The development of electrical reversing gear is an indication of progress.

Milling machines are a great asset in a manufacturing shop, especially where much duplicate work is done. An average cutting speed is about 70 ft. per minute, but this, of course, is dependent on the stock being removed. Feeds vary from ½ to 20 inches or more per minute, dependent on the work also.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

Grinding machines are now an asset to railway shops, being almost indispensable. These machines handle work roughed-out in other machines, and finish same quickly and accurately. Grinding is, in reality, milling on a finer scale, and motion pins and shafts are made cheaper and better than on a lathe. A wheel 24 inches diam., running at 5,000 ft. per minute, gives good results. At the C.P.R. Montreal shops, new piston rods are rough turned in the lathe only; the body being ground to size, removing 1-32 inch of diameter, with a wheel running at 5,000 ft. per minute. The rod is rotated at 20 revs. per minute, while the traverse of the wheel is 38 inches per minute. This entirely dispenses with the rolling operation.

Reamers and Milling Cutters.

There is a large amount of taper reaming done in connection with locomotive work, but very little seems to have been done, so far, towards getting better tools than those which have been in use for many years. The straight fluted reamer may be all right for parallel holes, but for taper holes the spiral reamer is superior to all others, long or short. The straight fluted reamer has to take a cut its whole length at one time by a drag or scrape process. The cutting action here is weak, for the length of the shaving prevents little more than a scrape being taken. The eccentric fluted reamer has the advantage of not chattering, and is superior to the ordinary equal fluted reamer, but with a spiral reamer, we have a shearing action by means of which a cut is started at one point, and carried until it leaves the edge of the tool. Spiral reamers should be made left-handed, so that it has a tendency to draw itself from the hole, and not into the hole. This left-handed spiral will, also, by the same tendency, clear itself of the chips, and will not clog nearly so much as the straight fluted reamer. The benefit of the spiral reamer is also shown in the fact that the power, required to drive it, is much less than with the straight fluted type of the same size. If made of high-speed steel they will do better service still, although they are most costly to make: the saving, however, will warrant the expenditure easily.

Milling cutters come in the same class as reamers, therefore, a few words on their economic manufacture is in order. The practice of using inserted toothed milling cutters for the larger sizes, is almost universal. Billet steel makes an ideal centre, and the blades should be made from old high speed machine tools forged to proper dimensions and machined to fit the grooves in the body. These latter are cut at an angle to the axis so as to approximate the ideal as nearly as possible,—the ideal being, of course, the spiral. The blades are fitted and lightly caulked in place, then turned over the top to required diameter. They are afterwards removed and hardened, then replaced and ground.

This straight blade cutter, however, has a disadvantage (not met with in spiral milled cutters) which is rather difficult to overcome. It will be seen that the clearance lip in front of the cutting edge, touches the work at varying angles throughout the length of the blade, therefore, if the blade is set so that its centre has the correct clearance lip, one end will have excessive and the other a minus lip, resulting in a drag action at that end of the cutter. This also produces uneven strains, which not only tend to loosen the blades, but put

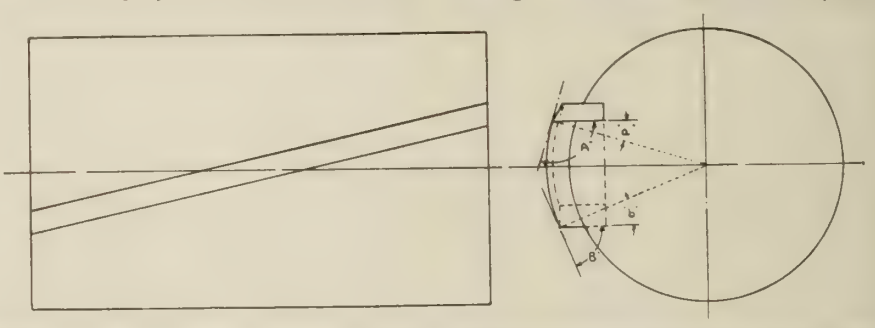
the whole cutter out of action just as soon as the weakest portion (where the scraping takes place) becomes dull. It is possible to set the blades back from the axis so that there is always a cutting lip, but excessive lip at the other end is thereby increased.

Little attention has been paid this feature until recently, and now, one company, at least, are milling the entire front face of the blades, which projects from the body. This obviates the evil entirely, and makes the tool the equivalent of a solid spiral milled cutter. The practice of making solid plain milling cutters entirely of billet steel is an economic one, and where the metal to be removed is of even character and not too hard, it is to be recommended, especially on new work of a straightforward nature. These tools are made precisely the same as any other cutters with spiral flutes, but are case-hardened as deeply as possible. Axle steel or any high carbon steel will make admirable cutters if properly case-hardened.

Shop Organization—Efficient Operation of Individual Machines.

Next in order comes the efficient operation of individual machnes. Machine speeds have gone up during the past few years, and the tendency is to go still higher. It is necessary to have a range of speeds on each machine suited to the class of work to be done. Take the case of drilling machines; since the advent of high-speed drills, the correct number of revs. per min. has increased on an average, 75 p.c. over the speed called for by carbon twist drills. Now, the extra high speed or flat twisted drill used on certain classes of work demands a speed 130 p.c. over the original speed for the same size of drill, therefore, unless drills are run at the proper speeds, they cannot work efficiently, so the value obtained is minimized. A machine, to drill holes from $\frac{1}{8}$ to $2\frac{1}{2}$ inches, needs a capacity from 50 to 500 r.p.m. High-speed drills less than $\frac{1}{8}$ inch diam., call for higher speeds than 500 r.p.m., but unless the machine is of modern design it is inadvisable to go above this, for the vibration set up not only racks the machine to pieces in a short time, but makes true holes difficult to obtain, and breaks many drills. Twist drills should never be used in cored holes, because flat drills, made from odd ends of high-speed tools, will do the work far better, and be much less expensive.

Railroad Shop Methods Standardization.



The standardization of shop methods has not been too seriously considered in railroad shops generally, until very recently. It becomes an essential feature in shops with piece work or bonus systems in vogue. There is, undoubtedly, a best method of doing a job, and it is possible to realize and maintain it. On new work, the standardization of methods can be accomplished without great difficulty, and even with repairs, much may be done in a like direction.

The cost of getting the necessary records for this purpose is more or less high, because it entails a scientific investigation of each move by the operator, and the conditions under which he works. Just as the scientist, who, in order to solve any complex problems, analizes each and every feature of the case very minutely, so must the same principle be applied to each shop operation, in order that details, insignificant in themselves, be brought to light for study as to essentials. If essential, then performance should be as efficient as possible. This investigation obviously necessitates a man trained in the work, it being beyond the capacity of the foreman to spend the time, or get the necessary information. The handling of material from shop to shop, and from machine to machine, is now brought down to a science. Locomotives coming in for repairs are ordered out by a certain date; in consequence, every required detail is scheduled to conform accordingly. This scheduling of work is comparable to that of train running. The dispatcher knows the location of all his trains and when due at the next point. He moves everything accordingly and secures continuous operation. On a like basis in our shops, similar and absolute control is obtained.

High Standard of Equipment Repair.

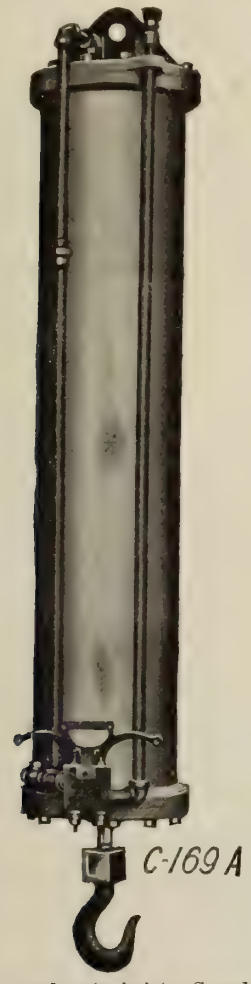
To have an efficiently operated shop, it is necessary to maintain a high standard of repair on every machine. Belts must not be neglected, and a system should be employed to enable the belt man to be located at all times. The class of hoist each man has at his command is of importance, and wherever practicable, individual hoist service is to be recommended. Jigs, labor saving devices, or ideas, should be encouraged, and advantage should be taken of the kinks put forward in our engineering journals to reduce shop expense.

In conclusion, I would point out that the foregoing is only the material side of the question of shop efficiency. It needs the co-operation of the whole staff to get results, and it has no place for a man who does not take a lively interest in every detail intended for the benefit of his shop. The co-operative effort of every workman is desirable, and the object in view, that of bringing the conditions affecting the shop to a point as unvarying as possible, whereby the greatest advantage may be taken of modern facilities and the abuse of same minimized. In short, to use the words of a well-known efficiency engineer, "Our object is to get the right job done on the right machine, in the right manner, by the right man, and at the right time." When we achieve this, we shall have an efficiently operated shop as far as the human element can make it.

Angles "A" and "B" show how angle between milled surface and front edge of cutter varies at each end of the blade. Angle "A" is actual clearance lip at one end. Angle "B" is the minus lip that causes scraping.

NEW TEN-WHEELERS FOR C. P. R.

The Montreal Locomotive Works are now building for the C.P.R. fourteen ten-wheel engines of the D4 class. They have 19x24 inch cylinders and 62-inch driving wheels, and the piston valves are operated by Walschaert valve gear. The boilers, equipped with the Vaughan-Horsey superheater, have a working pressure of 180 lbs. The engines will each weigh about 135,000 lbs., exclusive of tender, and they will be used on branch lines and for main line way-freight service. The C.P.R. are to build ten more of this class at their Angus shops, Montreal.



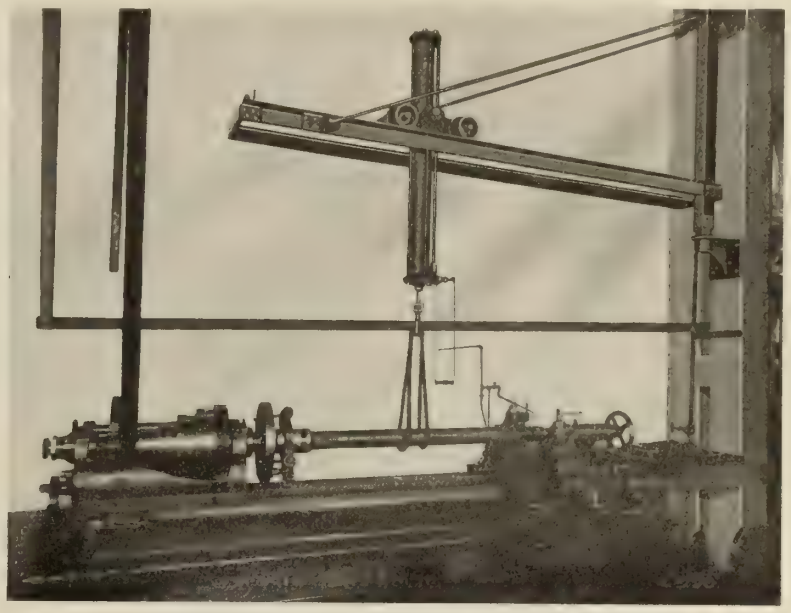
The consumption of aluminum throughout the world is increasing very rapidly according to a recent statement in the Daily Consular and Trade Reports. A German source is quoted as stating that in 1909 the amount consumed exceeded 34,000 tons—a marked increase over previous years.

CORRECTION.

The 500 h.p. electric motor driving the Canada Steel Co.'s rolling mill at Hamilton, Ont., was built by the Canadian Westinghouse Co., Hamilton, and not by the Can. Gen. Electric Co., as stated in the description of the mill which appeared in our November issue.

THE ALWAYS READY AIR HOIST.

IN industrial establishments of any size, the compressed air supply for general power purposes, may be said to have advanced its status from a mere convenience to that of an actual necessity, and works, pretending to business enterprise, without having a permanent and reliable supply of compressed air, are now the exception. Compressed air



The always ready air hoist.—Canadian Rand Co.

has proven itself an excellent servant for light, widely separated and occasional services, and it shows perhaps at its best when used for hoisting purposes. A direct-acting single cylinder air hoist, in its instantaneous readiness, quickness and precision of action, is without a rival in its special field, while the geared motor hoist cannot be surpassed for control of the rate of lifting and lowering, besides giving absolute certainty of keeping the load suspended anywhere, as long as desired.

In the employment of compressed air for the driving of steadily operated tools or machines, there is one particular condition, generally imperative. It is necessary to have a continuously running compressor, because it is not practicable to store air in sufficient quantity to last any length of time. With capacity adapted to its regular load, and production and consumption of air going on regularly, and at approximately equal rates, the compressor, with its air storage capacity as usually provided, can only be reckoned as about a single minute ahead of the demand, therefore, if it should stop for that brief space of time, all the machinery operated by it may be expected to be out of commission almost directly. This one minute of margin, however, compares advantageously with the electric drive, in which there is not a single second of stand-by.

It really needs little, reckoned in horse power, for any single operation of hoisting, and the time taken is very brief when compared with the intervals of rest between; therefore, a small compressor running continuously may supply several air hoists, without recourse to excessive or expensive storage capacity In shops where the air supply is maintained for operating pneumatic tools and numerous other devices, so common in railroad shops, consumption of air by the hoists is scarcely appreciable. To raise one ton, five feet high in one minute, requires only one-half horse power, including liberal allowances for friction and other losses, and this half horse power may be supplied from a compressor with one-tenth of that capacity or less by allowing it to work right along through the generally occurring intervals between lifts.

The always ready air hoist.—Canadian Rand Co.

ELECTRICALLY OPERATED OVERHEAD TRAVELING CRANES.

THE electrically operated overhead travelling cranes described and illustrated herewith were supplied recently by Royce, Ltd., Manchester, England, for the boiler shop of David Rowan & Co., Clydebank, Scotland. As evidence of the satisfactory results obtained from their installation, a duplicate order has since been received.

Features of Interest.

The principal features of interest in these cranes are those tending to safety of operation and economy in current consumption. The structural steel work, steel shafting, cast-iron, etc., entering into the manufacture, are each figured for strength and fitness according to British Government rules, ensuring thereby reliability on a basis of test and experience over a wide range.

Regarding safety in handling the raised load, it may be pointed out that duplicate electrical solenoid brakes are fitted to the hoisting motion, each being capable of holding with ease the rated overload capacity of the crane. Both brakes act simultaneously when the current is switched on or off the hoisting motor circuit, and are immediately applied should there be failure of the current supply from any cause. In addition to the foregoing, special controllers are supplied, fitted with dynamic or regenerative control for lowering the load. Further, the Royce governor gear attached to the hoisting motion regulates and prevents excessive lowering speeds with heavy loads. The possibility of brake failure or the sudden burning-out of the motor, either of which would make the load uncontrollable, is thus provided for in the combination above described, and ensures against descent at an unsafe speed. To the hoisting brakes, there is also fitted a hand release arrangement, enabling the operator to lower any load that is heavy enough to revolve the gearing, without expenditure of current.

Improved roller bearings are fitted to the end carriage travelling wheel axles, and also to the axles of the crab or

trolley upon the bridge. These greatly contribute to economy in current consumption. An adjustable slipping drive by gearing is fitted to the longitudinal travelling motor, which absolutely prevents overloading the latter from such a cause as the too rapid acceleration of the crane, etc. It, at the same time, acts as a most powerful brake in stopping the travelling of the crane, in cases of emergency, and is quite a separate arrangement from the usual foot brake operated by the attendant in the cage or cab.

Over-hoisting safeguards are fitted to both the main and auxiliary hoisting motions, which in the event of lifting a load too high, open the circuit in the hoisting direction only, so that while it may not be lifted higher, it can be lowered by reversing the motor or using the hand release arrangement referred to. When a certain predetermined point has been passed, the lifting circuit is again automatically restored without further attention.

To overcome the possibility of loose keys in pinions, etc., the makers have adopted the principle of forging pinion shafts out of stock equal in diameter to the pinion. This puts the vexed question of loose keys and broken pinions beyond a possibility.

All gearing upon the crab, wherever possible, has been placed inside the bearings, thus facilitating the replacing of a bearing sleeve. All bearing sleeves are semi-spherically seated, and can easily be slipped into position without disturbing the gearing. Further, this arrangement allows of the gear of the main hoisting barrel being mounted directly upon the end of the barrel. This gear ring is made up of a wrought steel ring forged from a billet and shrunk on. Such a method indisputably overcomes any possibility of hidden blow-holes, and consequent broken gears, or even gear teeth, as may be the case with steel castings.

All the motors are of the six pole, totally enclosed slow speed type, especially designed and built for crane work. The commutators are mounted upon the armature spiders, so that it is quite possible for a mechanic to replace a shaft without disturbing the connection between the armature coils and commutator. All carbon brushes and brush holders in the several crane motors are of the same size. Field coils can be replaced without removing the armature from the motor frame and disturbing the shaft couplings. The bearings are ring lubricated and absolutely oil retaining. All the detailed parts of the crane, including motors, controllers, etc., bear a distinguishing number to facilitate ordering of spares, and all similar parts are strictly interchangeable.

Respecting wiring of the cranes, all wires are run within solid drawn steel tubing, the fittings for which, such as bends, tees, etc., are screwed together, and insulating bushings used to prevent chafing. Where the wires leave the tubing, this allows of no possibility of damage caused by the constant vibration of the crane in operation. There is also provided and fixed in the cage a suitable terminal board, enclosed under cast iron covers, by the use of which it is possible to separate the circuit of the motor from its respective controller for testing, when necessary.

The makers seem, as far as it is possible, to have designed the parts to make everything easy of access, and have provided hand operating gear to all motions.

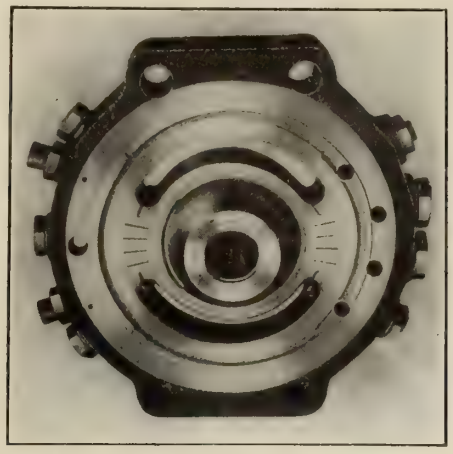
Electrically-operated overhead traveling cranes manufactured by Royce, Ltd., of Toronto and Manchester, England.

Among orders received during the past 18 months, may be mentioned two overhead travelling cranes of 350,000 pounds capacity, for the Kawasaki Dockyard, Japan, and two cranes of similar size and capacity as those, for David Rowan & Co., for Lobnitz & Co., Renfrew, Scotland.

The Canadian business of Royce Ltd., is directed from their registered office, Lumsden Building, Toronto, by C. S. Mallett, a gentleman of large experience and intimacy with the firm's product as a many years' employee.

CANADA CAR AND FOUNDRY CO.

The Canadian Car and Foundry Co. has received an order from the Grand Trunk Railway for two thousand freight cars (making four thousand cars ordered by this progressive railway in two weeks), and another order of twenty-five thousand freight cars from the Canadian Pacific Railway. Regarded as an econ-

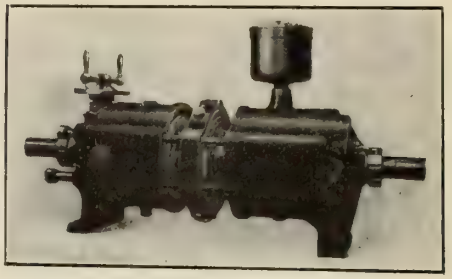


Knock-down interior—Universal Transmission

omic factor in the general situation, it shows that business in Canada, at least, is going full tilt ahead. Mr. Curry, president of the Canadian Car and Foundry Co., stated recently that general conditions were improving in their readjustments, and that the company would soon find itself in a comfortable position. The above orders, just entered, go far towards a fulfilment of the views expressed.

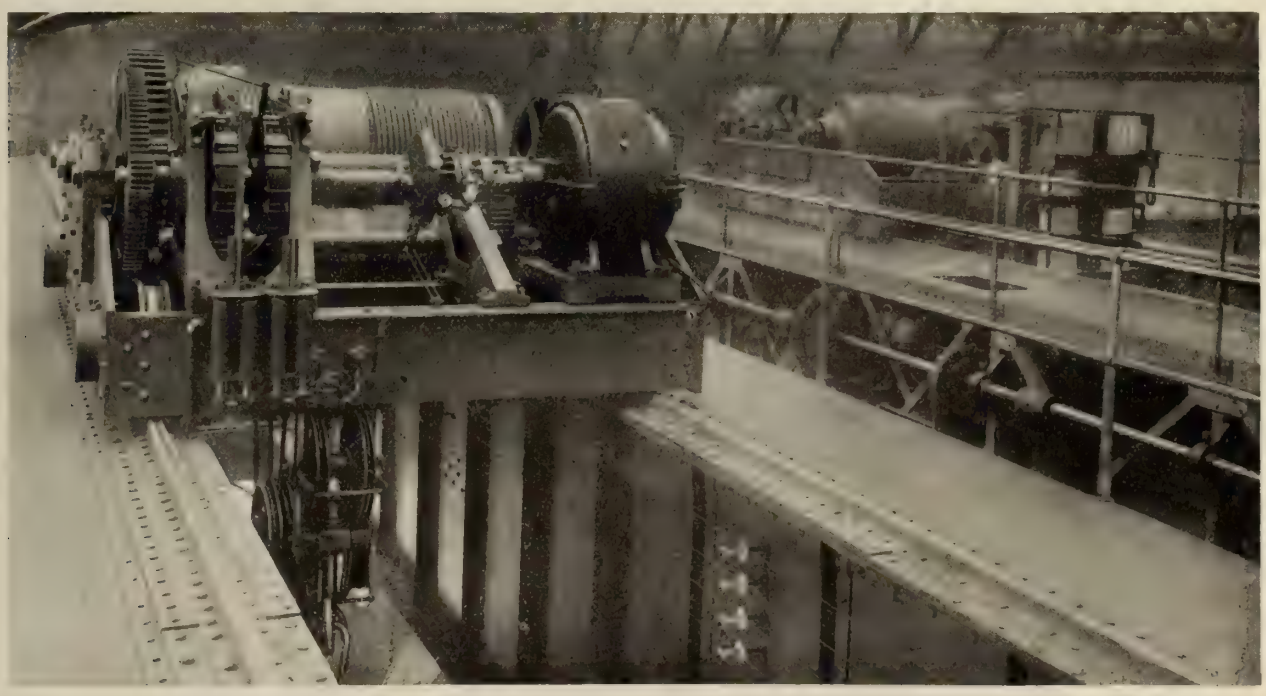
UNIVERSAL TRANSMISSION.

A new device has recently been invented known as "Universal Transmission" by which it is possible to transmit pawer from one form of



Valve plate—Universal Transmission.

apparatus such as a motor, steam engine, or other prime mover capable of revolving on an axis, to another apparatus in the immediate neighborhood of the first. The value of this transmission scheme lies in the fact that it is very efficient, that revolution in either direction may be obtained, although the prime mover revolves continuously in one direction, and that any required part of the energy of the prime mover may be utilized at will, without steps or abrupt gradation.



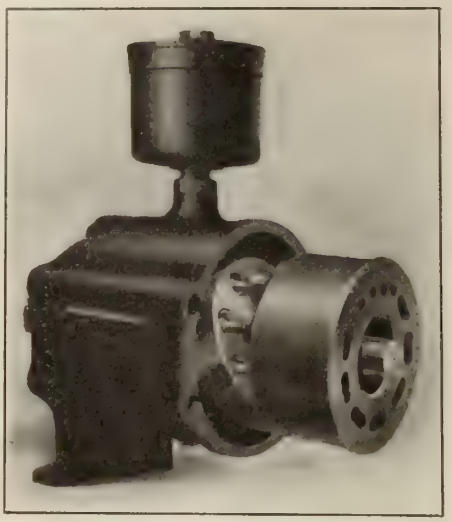
Constructional Detail.

The universal transmission apparatus consists of two revolving parts each operating on a longitudinal axis, although their axis need not necessarily be in the same straight line. In each half or part of the system, a number of pistons and cylinders are placed around the main axis and parallel to it, so that their pistons, when operating, move back and forth in a direction parallel to it. The heads of the piston rods are held in what is known as a head-plate through the centre of which the main axis passes. The head-plate in each case is normally at right angles to the main axis but may be tilted, at any angle to it, by a simple adjustment. Each part of this mechanism is enclosed in a stout metallic casing, and revolves in oil which occupies all the space inside, not taken up by metal.

Assembly, drawn apart—Universal Transmission.

The two parts of the apparatus are separated by a mid-plate through which two passages on opposite sides of the plate connect the two halves of the system. If, when the head-plate is at right angles to its axis, either main axis revolves, there is no motion of the pis-

Electrically-operated overhead traveling cranes, manufactured by Royce, Ltd., of Toronto, and Manchester, England.

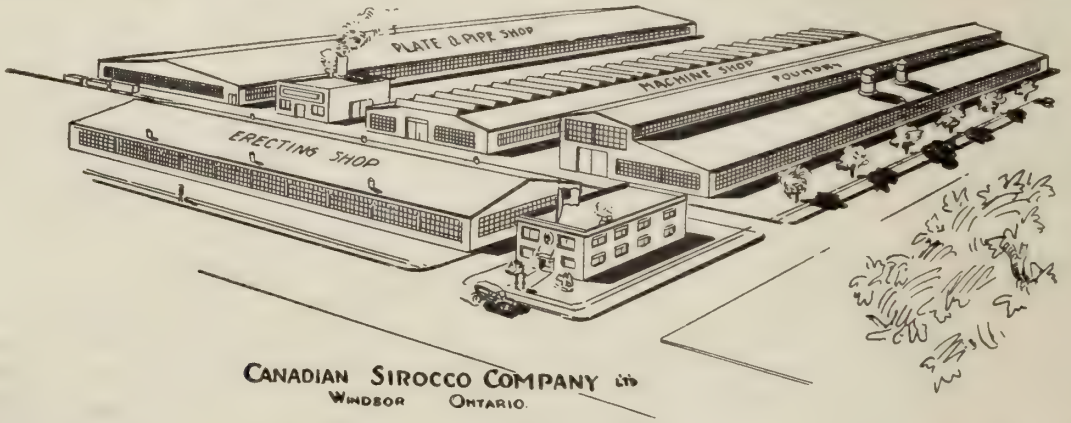


tons in their cylinders. Slightly tilting the head-plate causes the pistons to work, and the head-plate revolving sets up a current in the oil from one half of the system to the other half through the passages in the mid-plate. The current, produced by the pistons operating in one end, causes the pistons in the other end to operate in unison, which in turn continues the revolving motion. The amount of energy transmitted depends on the angle at which the head-plate is held. By simply reversing the angle the second end is made to rotate in the opposite direction.

The scheme as yet is limited in its application, being so far specially designed for turret and gun control in naval work. The apparatus is being manufactured by the Universal Transmission, Ltd., of New York, and is being introduced on the Canadian market.

THE CANADIAN SIROCCO CO., LTD.

THE American Blower Co., Detroit, Mich., with factory also at Troy, New York, and branch offices throughout the world, have come to realize the industrial importance of the Dominion of Canada, as evidenced by the charter application just filed, for a company to be known as the Canadian Sirocco Co., of Windsor, Ontario. This company has acquired from the City of Windsor, a tract of land, centrally located, comprising about 4½ acres, situated on the Essex Terminal Railway, and will proceed at once with the erection of a plant, which, when completed, will doubtless be one of the most complete of its kind on this continent. Work is to proceed at once on the construction of the erecting shop, (50 x 200 feet) which will be of steel and concrete construction, also the office building. This is about all that seems possible of completion for occupancy this winter, and probably the foundry building will come next, and be started in the spring.



The company will hold the exclusive patent rights for the manufacture in Canada of the famous "Sirocco" fans and blowers, which have revolutionized the blower business of the world by their space and power-saving features. These patents are controlled in the United States, the U.S. possessions, Mexico, Central and South America and Japan, by the American Blower Co., and in Europe, by Davidson & Co., Sirocco Engineering Works, Belfast, Ireland, home of S. C. Davidson, the inventor.

Driven end—Universal Transmission.

Sirocco fans are being largely specified and used throughout the world for mechanical draft on boilers, mine ventilation, heating and ventilating plants, for public buildings, school houses, factories, stores, and in the British navy. The Canadian Sirocco Co. will also manufacture the full line of the American Blower Co. products, consisting of fans, blowers, heating, ventilating, drying apparatus, steam engines, steam traps, etc.

The Canadian Sirocco Co. enters the Dominion of Canada with the complete engineering staff of The American Blower Co. at its disposal, and the City of Windsor has been fortunate in securing this important industry.

CENTRAL RAILWAY AND ENGINEERING CLUB.

On the evening of Friday, December 1st, The Central Railway and Engineering Club of Canada held a very enjoyable "smoker" at the St. Charles Hotel, Toronto, when about 250 members and their friends were present. The earlier part of the evening was devoted to euchre, after which refreshments were served. The company then settled down to enjoy an excellent program of music, etc., provided by Mr. H. G. Fletcher, chairman of the reception committee The various items were received with much favor, not the least popular being a ventriloquial "turn" by Mr. Kelly.

UNITED ENGINEERING & FOUNDRRY CO.

Suit was entered Nov. 27th, 1911, in the United States Circuit Court of New Jersey, by the United Engineering & Foundry Co., of Pittsburg, Pa., against R. D. Wood & Co. and the Camden Iron Works, for infringement of patents controlled by it on steam hydraulic forging presses, working on the single lever automatic cut-off principle, of which the United Engineering & Foundry Co. has in operation eighteen presses ranging from 150 tons to 5000 tons capacity.

GEOMETRIC THREADING MACHINE.

THE Geometric Threading Machine, illustrated and described on pages 308 and 309 of the November issue of Canadian Machinery, is the product of the Geometric Tool Co., New Haven, Conn.

Mr. Lever, the big soap man and noted philanthropist, speaking near Bolton, England, lately, said he knew of employers who asked were they their brothers' keepers? If they were stronger, and had more intelligence and more opportunities, then they had the responsibility of helping their brothers. They should pay the highest salary that an industry could afford, and should fix wages as if for their brothers and sisters. Dividends and wages should have at least equal consideration, and if there was to be any tendency to advantage, it must be with wages.

A NOVEL COUNTERBORE.

By A. D. Campbell, Hamilton.

THE counterbore here shown, in the course of over twelve months' service, has proved a useful tool for facings and recesses for hexagon nuts and bolt heads. The taper shank and arbor or spindle, are of tool steel (Jessop's), made in one piece; the tang of the shank being hardened and tempered, as is also the end of the spindle, to prevent cutting and burning. Referring to Fig. 1, the high-speed steel cutter is double-ended, one set of teeth doing the cutting, while the other set is engaged by teeth

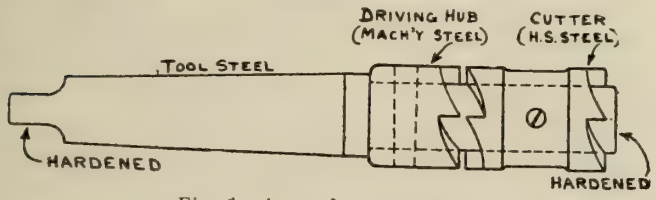

Fig. 1.—A novel counterbore.

of corresponding shape on the driving hub. This hub, of machinery steel, is shrunk and pinned upon the spindle after the latter has been ground all over. That part of the spindle which enters the hole to be faced is ground .005 inch small to prevent binding.

When one end of the cutter gets dull, it can be reversed and the other end used. If it wears out, a new cutter can be quickly and cheaply made, or the old one can be annealed and the teeth cut deeper. The headless set screw shown is merely to keep the cutter from dropping off the spindle. From Fig. 2 and its corresponding table Fig. 3, the dimensions of spindle for various sized bolts may be obtained, while the other table, Fig. 4, gives the dimensions of the driving hubs and cutters.

AN IMPROVED RAIL CLAMP.

THE "Canal Record" gives the following description of an improved clamp used in the construction tracks, and invented by W. H. Bates, superintendent of steam shovel repairs. After a six months' trial, it is now permanently adopted, and 350 pieces of the apparatus have been ordered for service.

The function of this clamp is to act as a "stop," when a steam shovel is moving forward, to prevent its running off the end of the track; also to "block"

Improved rail clamp.

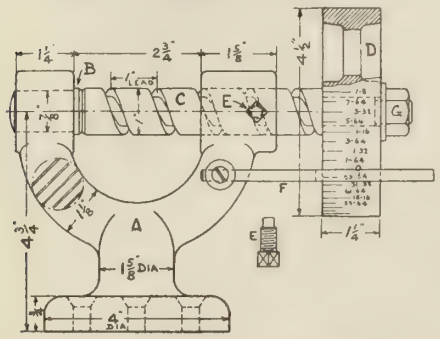
the truck wheels securely in place when the shovel is working. The clamp used previously, was attached to the rail by means of a key driven under the base of the rail, consequently it was necessary to place the clamp between ties. When the track is in mud and water up to the rails, the annoyance and delay incident to attaching the old clamp were considerable; furthermore, the ties often interfered with locating the clamp where desired.

The new clamp is fastened to the rail by means of a tapered key of steel passing crosswise over the rail, and thus permits its being set directly over a tie, or otherwise. The key being above the rail, avoids mud and water.

The principle, on which the apparatus works, is similar to that of a pair of ice tongs. The clamp consists of two steel castings which form the hooks and body of the ice tongs as well as a convenient handle. These castings are fastened together by means of a heavy rivet which acts as a hinge pin. The hooks bear on the under side of the rail head when the wedge is driven above the rail and below the hinge pin; thus giving a secure grip on the rail. The cost of the new clamp is considerably less than that of the old style.

A DRILL GAUGE FOR THE TOOL CRIB.

By Chas. Hattenberger, Buffalo, N.Y.



THE gauge herewith illsutrated is in principle a micrometer caliper of special form, adapted for quickly measuring drills, reamers, counterbores, etc., which have no size stamped on them, or have had the marks obliterated. Such a gauge screwed to a bench or rack in a convenient spot will save the toolkeeper much time spent in trying the sizes with ring gauges or ordinary calipers. The gauge consists of a cast-iron stand A, having two arms, one of which is drilled 7/8 inch diameter to take the an-

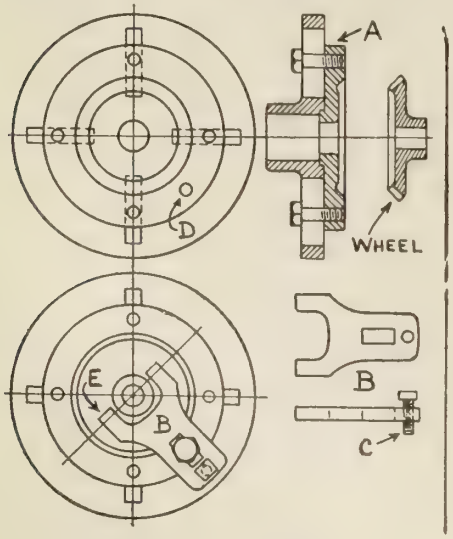
Fig. 4.—A novel counterbore.



vil B, which is pressed in. The other arm is not screwed, but is bored out plain to take the measuring screw C, 1 inch diameter. The lead of this screw equals one thread per inch, the groove being ¼ inch wide and 3-16 inch deep. One end of the screw is turned down to fit the hub of the cast-iron wheel D. The latter has four spokes and is turned to 4½ inches diameter. The circumference

Drill gauge for the tool crib.

is then graduated in the milling machine into sixty-four parts, which are marked from zero to 63-64. A small screw E fits into the groove of the measuring screw and acts as a nut.

Readings are taken by means of the straight edge F, which is made of round cold-rolled stock, and is filed flat for a portion of its length, in order that it may be brought close up against the wheel and clear readings obtained. Its round end is clamped in a boss which projects from the casting A. When the end of the screw C is touching the anvil B, the wheel must be adjusted on its spindle so that the zero mark comes in

Jig for bevel wheels.

line with the top of the straight-edge F. It can then be secured permanently in position by the nut G. The face of the anvil and end of the screw should be case-hardened with cyanide, and the base of A drilled for three holding-down screws.

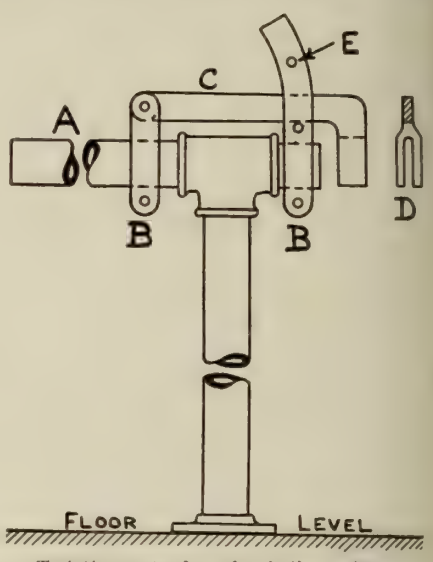
Readings are obtained by inserting the drill, or other tool to be measured, between the end of the screw and the anvil and reading off the size on the wheel at the straight-edge. If the drill is larger than 1 inch, a number, equal to the number of revolutions of the wheel from zero, must be added to the reading. Thus, in gauging a 1¼ inch drill, the wheel will make one complete turn and stop at the ¼ mark. Similarly for a 2¼ inch drill, the wheel will make two and a quarter turns. In practice the toolkeeper does not need to keep track of the number of revolutions. The fractional reading is all he needs, since his eye enables him to tell whether the reading is for a ¼, 1¼ or 2¼ drill.

A METHOD OF TWISTING RETARDERS FOR BOILER TUBES.

By W. H., Collingwood.

FOR the benefit of those whose occupation does not bring them into close touch with boiler work, it may be as well to explain that a retarder is a long thin narrow plate twisted into a helix and inserted in the tube; its purpose being to give a rotary motion to the hot gases and to reduce the speed of their passage.

In the shops of the Collingwood Shipbuilding Co., Collingwood, Ont., such retarders are frequently called for as part of the equipment of Scotch marine boilers built there, and the following method is employed for twisting them.



The retarders for 3-inch tubes consist of steel strips 10 feet long by 2½ inches wide by ⅛ inch thick. One end is gripped in the chuck of an ordinary bolt cutter, while the other end is prevented from turning by the device here illustrated.

This latter is made up from 3-inch w.i. pipe, and besides gripping the free end of the retarder, also keeps it straight. The pipe A stands at the same level as the centre line of the bolt cutter. Two clamps B.B. are bolted round the pipe, and a swinging arm C is fulcrumed to one of them. This arm has a narrow jaw at its free end, as seen in the end view D, and may be raised-up above E, to receive a pin, when required. The strips to be twisted are inserted in the tube, three at a time. At one end they are gripped in the bolt cutter chuck, and the jaw of C brought down over the other end prevents them turning. The bolt cutter is next started on its lowest speed, and the twisted effect produced throughout the entire length of each retarder.

JIG FOR BEVEL WHEELS.

By G. Barrett, Montreal.

FOR boring mitre, bevel or skew gear wheels, the jig here shown will be found useful in a shop doing much repetition work of this class. To make the jig, proceed as follows:—Take a circular plate A, about one inch thick by nine inches diameter, and turn it up true all over, leaving a boss on the back about ¼ inch high. Next, put a recess in the lathe face-plate, slightly deeper than the boss, and fit the latter nicely all round, so that the jig can be set in place by a few light taps of a hammer handle. The slots in the face-plate are now marked on the jig A, and the latter drilled or tapped for two or more set screws, as shown. Replace the jig, tighten set screws, and rough-out the face a little smaller than the outside diameter of the teeth of the wheel to be bored, keeping the angle correct. Then

Twisting retarders for boiler tubes.

skim up, till the face and the inside corner of the teeth bed themselves on the jig. Next, make a clamp, as shown at B, to hold the wheel in place while being bored. This may be made of ½-inch or ¾-inch steel plate, the jaw being cut out large enough to clear the boss on the back of the wheel. The set screw C serves to adjust the height, being tapped through the clamp and bearing on the face plate. The jig has a tapped hole at D, to take the set screw which secures the clamp. The slot in the latter, allows it to be adjusted longitudinally on the former. The jaw should be made long enough to reach beyond the centre line, as shown at E, to ensure the wheel lying flat on the jig.

Separate jigs can be made to suit different sizes and types of wheels, each jig being marked for its own class. It is well to put a mark on top of the jig and a corresponding mark on the lathe face-plate so that the jig may always be replaced in the same position.

I have introduced this arrangement into several shops and have always managed to increase the output by about 50 per cent.

TIRE-HEATING APPARATUS.

By R. N. Saunders, Montreal.

THE accompanying cuts show an apparatus for burning crude oil and designed to heat tires in batches of six or more at one time. It is in successful use in the Angus Shops, of the C.P.R., where it is handling truck wheel tires up to 40 inches in diameter. The tires are stacked on top of each other upon a fire-brick base, hollowed out in the centre. As seen in fig. 2, the base has three air passages leading from the centre to the outside, their purpose being to relieve the pressure set up inside the tires by the air blast, while the hollowed centre gives upward direction to the hot gases, and thereby distributes the heat more evenly over the whole pile.

A is a cast iron pipe enlarged at one end, C and B is a Rockwell oil-burner, coupled by means of flexible metallic hose to the compressed air and oil lines. The open end of the combustion chamber C, is covered by a perforated plate E, with one-inch hole at the centre, opposite the burner. This plate allows sufficient air to be drawn in to secure complete combustion in chamber C and pipe A. The fierce flame, issuing from A, strikes the fire-brick base, and is thence deflected upwards, as shown by the arrows in fig. 1. A circular steel plate, about 3-16-inch thick and of sufficient diameter to cover the largest tires heated, is bolted to the end of pipe A. It is lined with asbestos, the purpose being to conserve the heat. The whole apparatus is carried on a cast iron bracket, which can be adjusted vertically on the supporting column by means of the balance weight. Bolt D, working in a slot in the column, prevents the bracket from swinging round. The circular plate is maintained at a height of 3 to 5 inches above the top tire, in order that the burnt gases may freely escape.

This heater is giving excellent satisfaction, and will heat six tires in from twenty to twenty-five minutes. Previous to its installation, tires were heated singly by city gas, the time occupied for each being about eighteen minutes. The lower tires get more heat than the upper, but this is an advantage, as otherwise, they would cool down too much during the time occupied in shrinking the upper tires on their wheel centres. The vertical column supporting the burner, etc., is of wrought iron pipe, and can turn freely in the socket at its foot. When the tires are sufficiently heated, the whole apparatus is swung round out of the way, enabling the crane to operate.

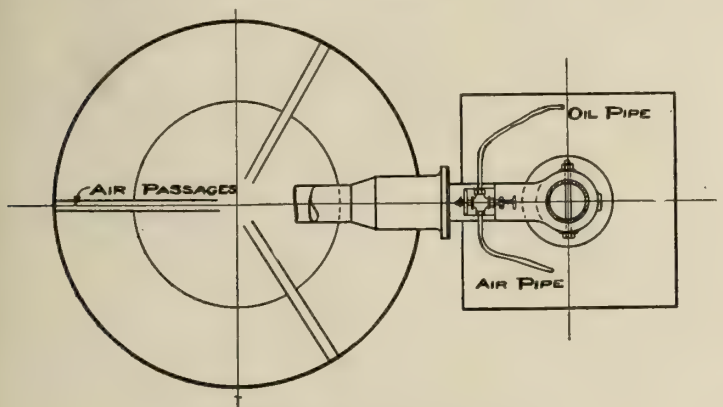


Fig. 2.—Tire heating apparatus.

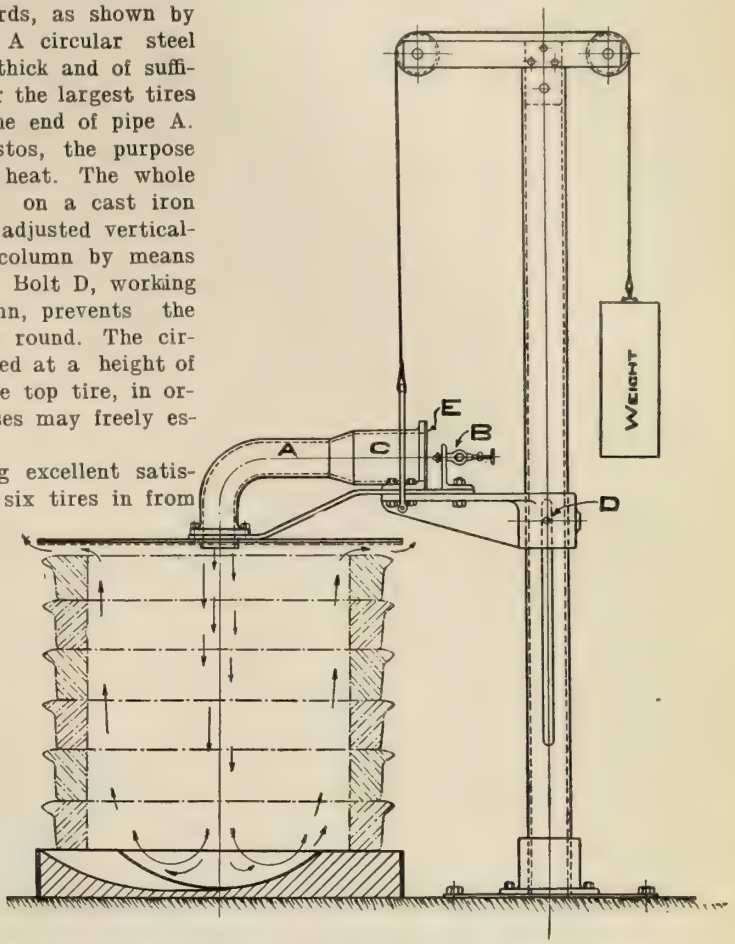

Fig. 1.—Tire heating apparatus.

Mechanical Drawing and Sketching for Machinists*

By B. P.

A Series of Progressive Lessons Designed to Familiarize Mechanics With the Use of the Apparatus Necessary to Make Simple Drawings, to Encourage them to Realize How Important a Factor it is of Their Equipment, as Well as Being a Profitable Pastime.

HEREWITH there is shown a cast iron eccentric strap, suitable for the eccentric which formed part of the November lesson. As may be seen in Fig. 1, the two halves are separated, but in making the drawing, they should be assembled, and if convenient, including the eccentric as well. The two halves of the strap are held together by the bolts B, and the eccentric rod is attached by means of the bolts C. The straps can be adjusted for wear by filing the faces which bolt together. In most cases, the straps do not meet at the centre line, as in this example, but stop ¼ inch each side of it; a ½ inch strip or liner, being inserted, and removed for thinning down as wear takes place in the strap body. It is also a common practice to insert a liner of brass or white metal between the eccentric and the strap to reduce friction. Such an arrangement is shown at A. The oil cup on the back half is cast solid with the strap and is tapped out at the top to receive the hexagon brass cap.

Exercise. — As the drawing has been purposely left incomplete, show the nuts correctly; add in plan, a section along the centre line, and give an end view looking in the direction of the arrow.

Note that the bolts are prevented from turning in the holes by feathers, or dowels, 3-16 inch diameter. The oil cup and its cover are not quite fully

* Tenth of a series of an Instruction Course.

dimensioned, but the student should nevertheless be able to give it correct proportions. A scale of ½ size, (3 inches to 1 foot) will be suitable for this drawing.

Rachet Wheel.

Fig. 2 shows a ratchet wheel and the method of laying out the teeth. Put down the centre lines for the upper view and draw the three inner circles. Then set the compasses to a radius of 2⅝ inches and lightly draw a circle to represent the outside diameter over the teeth. The depth of the teeth is not directly stated, but from other dimensions given it is found to be ¼ inch and another circle is lightly drawn to represent this amount. Next divide the circumference of the outer circle into the same number of parts as there are teeth. If the number of teeth be an odd quantity, like 29 or 37, the only way to proceed is to set the dividers to the approximate pitch and step off the distance all round the circle; re-adjusting the dividers on arriving again at the starting point and repeating the process until the exact pitch is found.

In the present example there are 30 teeth,—a very convenient number. Since a circle contains 360 degrees, there will be 60 degrees in one-sixth of a circle, and one-sixth of 30 teeth is 5 teeth; hence if we take the 60 degree set-square, and draw a line from the centre at an angle of 60 degrees with the horizontal, and then divide the arc cut off by this line into five equal parts, we shall obtain the pitch of the teeth much quicker than if we divided the whole circle. We, therefore, divide the arc A. B. into five equal parts and mark off the pitch thus obtained all round the circle. From each point, draw short radial lines, representing the faces of the teeth; the backs of the latter being obtained by joining the point of one tooth to the root of the next.

The key securing the ratchet wheel to its shaft is ⅜ inch wide by 3-16 inch thick and is embedded equally in wheel and shaft. The hub is 1¼ inches wide and the rim ¾ inch wide, while the thickness of the web connecting them is ⅜ inch.

Exercise.—Draw full size, making lower view in section, and giving an outside view to the right of the elevation.

THE PRESENT BUSINESS CONDITION.

TO the thoughtful citizen it is apparent that the tendency of much of the state and national legislation is to depress rather than to encourage activities which make for the country's material advancement and prosperity. Political and social unrest find expression in extreme measures which seriously disturb economic stability. Radical and unwarranted legislation is proposed as the panacea for every ill and every shortcoming. Poltical mountebanks feed upon prejudice and build upon hatred and selfishness. The pendulum of public opinion, therefore, has swung to extremes and has caused apprehension and uncertainty where confidence and certainty should prevail.

In the meantime a country whose normal temperament is hopeful and optimistic, a land of wonderful resourcefulness and boundless possibilities, of remarkable energy and constructive ability, is languishing under a prolonged industrial depression.

That the panic of 1907 was primarily a financial disturbance which should be followed by a period of industrial depression was to be expected. That this depression should be prolonged over a period of years is unwarranted and must be laid to causes which should and must be removed. Be it therefore

Resolved, that, in the judgment of the National Founders' Association the time has arrived when the country should awaken to the real situation, discountenance public expressions and legislative action designed to discourage legitimate enterprise and commercial and industrial development, and denounce the political tinkerers who destroy confidence and undermine the economic stability of a great nation. And be it further

Resolved, that we bespeak for the American people a returning confidence in themselves, a conservative attitude on all controversial problems and the application of sane methods to their solution; a more friendly co-operation between capital and labor, between employer and employe; that we impress upon the agencies of government the duty to promote rather than retard the progress and prosperity of a whole people.

* Statement and resolution adopted at fifteenth annual convention of National Founders' Association, New York, November 16, 1911.

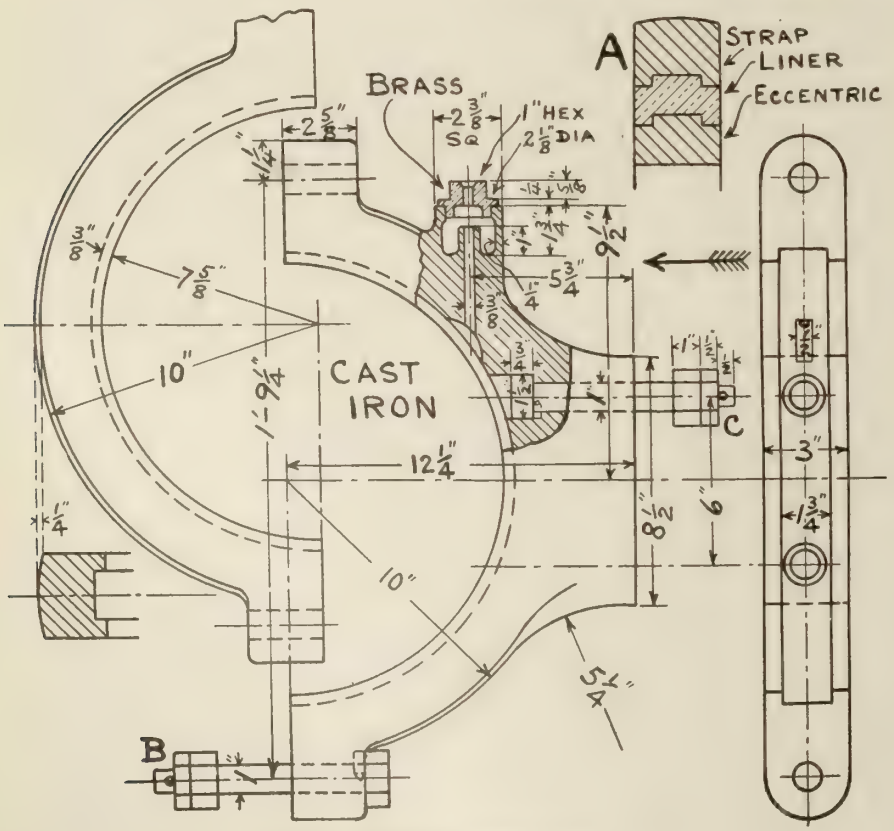

Fig. 2.—Drawing and sketching.

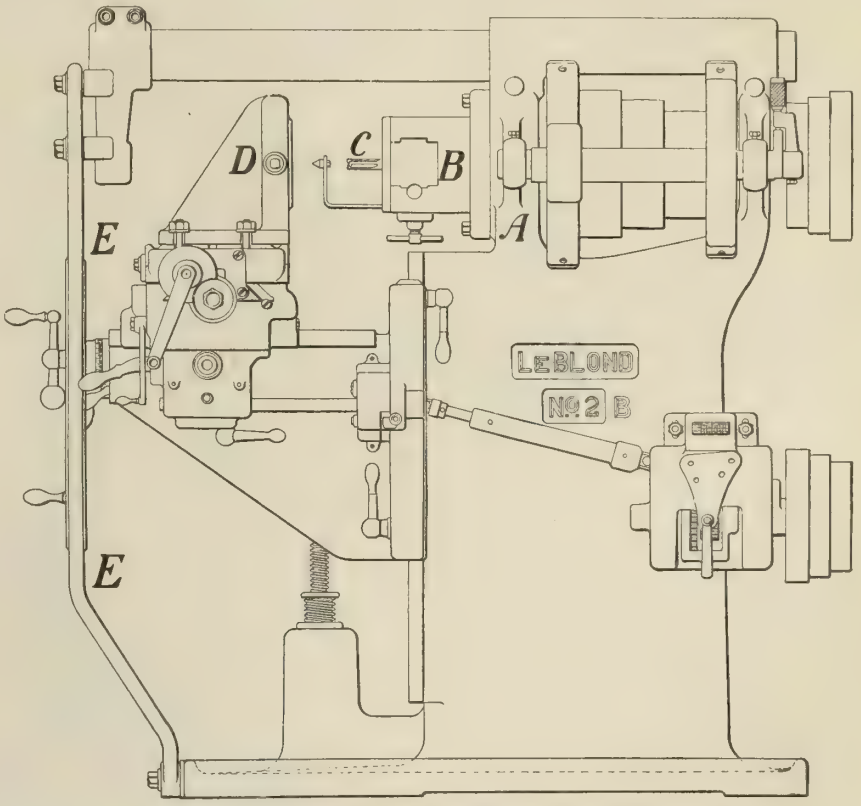
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tendtng Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

A NEW MACHINE TOOL.

MUCH has been written pertaining to the problem of boring square holes, and the attempts towards the construction of a practical tool for this class of work have been numerous. Various devices in the shape of attachments for ordinary lathes or milling machines, etc., have been recently offered in the market, but they have failed to produce satisfactory results, owing to the difficulties in the proper mounting of the device on any standard machine tool. Experiments have, however, conclusively proved that such attachments cannot be fastened rigidly enough to withstand the side thrust caused by the eccentric jarring motion of the cutter, at right angles to the working spindle. It was further demonstrated that the carriage of the average lathe did not offer sufficient stiffness to hold the working pieces rigidly in position. This is one of the vital points in obtaining perfectly square holes.



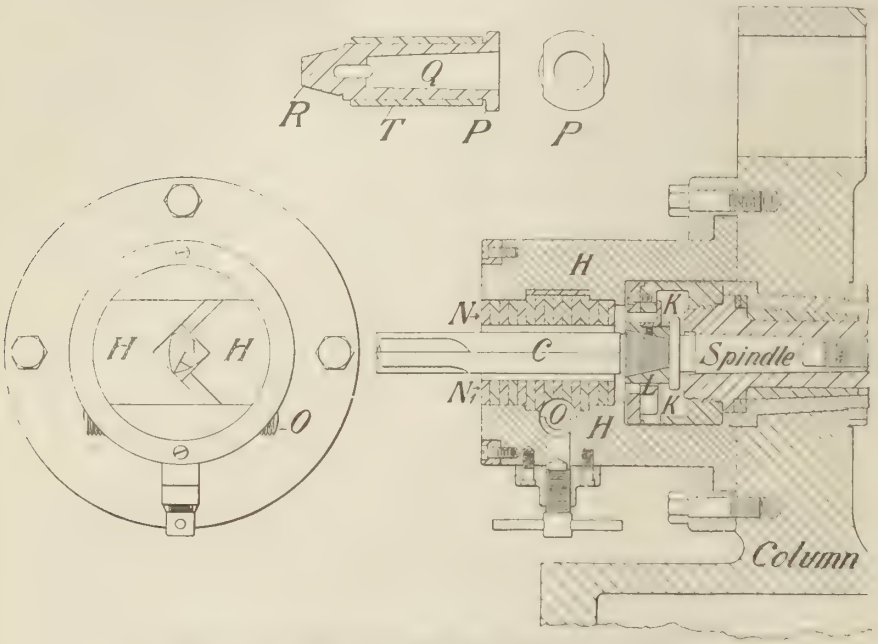
The R. K. LeBlond Machine Tool Co., Cincinnati, Ohio, who enjoy the reputation of being leading machine tool designers, have taken an interest in this problem, and after careful study of the subject and its former weaknesses, have come to the conclusion that this work can only be done satisfactorily with a special machine tool, in which the arrangements for cutting square holes are embodied in the design. Considering, however, that a machine which would do nothing else but cut square holes, would be too great an investment to many customers, they have designed a combination machine tool which is not only adapted for milling square holes, but also possesses all the features of a standard milling machine.

It is designed along the lines of the LeBlond No. 2 plain milling machine, with such changes as are of advantage to the successful operation of the square hole cutters. The principle used in this work is the same as employed in other devices, namely, the revolution of a triangular shaped bit, similar to an end mill, in a stationary master guide of appearance much like a regular drill chuck. This stationary guiding chuck is fastened directly to the column of the machine by means of a flange, and entirely eliminates all the former troubles of lost motion.

The cutter receives its motion from a special driving member fastened to the nose of the spindle. This not only causes the cutter to rotate, but at the same time gives it freedom to travel eccentrically in the master guide. The whole arrangement for cutting square holes, simple in itself, is easily detached, the machine being then ready for regular milling work or vice-versa. As it is advantageous, when cutting square holes in tough material, to previously drill a round hole, the machine is furnished with an appliance for operating ordinary twist drills, and which engages in the arrangement for boring square holes. Both operations can be done in succession on the same workpiece.

As the attachment for cutting square holes projects considerably beyond the nose of spindle, it would on a standard machine decrease the working space in front of the cutter, therefore, the column bearing the main spindle has been set back to gain the distance taken up by this projection, thus maintaining the full working range of the table. In order to secure absolute rigidity of the work pieces on the table, a special brace is provided which connects the knee with the overhanging arm as well as with the base of the machine.

As the cutting of square holes requires a very fine feed, the machine is arranged with two separate cross feeds, one for regular milling work and the other for extra fine feeds starting from .001 inches. In cutting square holes, the work must be held absolutely rigid, a special vise being furnished with the machine for this purpose. The possibility of using this machine for regular milling work, as well as for cutting square or rectangular holes and other odd jobs, will make it a valuable addition to the equipment of every toolroom, to say nothing of regular manufacturing purposes where square holes are used for commercial work. Fig. 1 shows a side view of the complete machine; fig. 2 shows an axial cross section through square hole cutting arrangement, and fig. 3 illustrates the appliances for the operation of twist drills.



New machine tool.—The Niles-Bement-Pond Company.

Detail Description.

Fig. 1.—A, column with main spindle bearing; B, Detachable chuck for cutting square holes; C, the cutter; D, special vise for holding work; E, special brace connecting knee with overhanging arm and base G.

Fig. 2 :—The square hole arrangement shown in this cross section con-

sists mainly of two separate bodies. 1st—the driving member K, which is screwed to nose of spindle; 2nd—the stationary guiding chuck H, which is bolted to the column over main bearing. The driving member contains a floating driving dog, L, into which cutters C engage by means of a taper thread. Behind this dog is a floating thrust plate

New machine tool detail.—The Niles-Bement-Pond Company.

which takes up the end of drills. The stationary guilding chuck contains the master guide, which consists of two jaws N.N-1. forming an adjustable square guiding hole in which the drill C is forced to describe its particular cam motion. O is a right and left hand screw for opening and closing these in accordance with size of drill used.

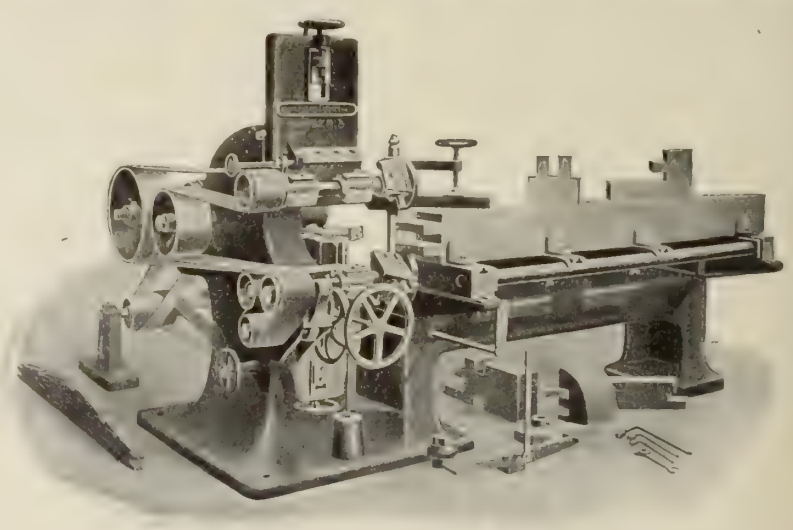


Fig. 3, for boring round holes in connection with the arrangement for cutting square holes. A round bushing, T, is inserted in the square guiding hole, which serves as a bearing for the shank R, and contains a regular Morse taper Q. This shank is fastened in the driving member by means of the taper thread R, and describes a regular revolution inside the bushing T. Any size twist drill can be inserted in the Morse cone, and the whole arrangement is easily taken off. The machine is furnished with complete equipment for regular plain milling. The range for boring square holes is from ¼ to 2 inches.

It is evident that the installation of such a machine tool, which is always handy as a regular plain miller, will open new fields of manufacture and will be of value to every tool-room for special work of all kinds.

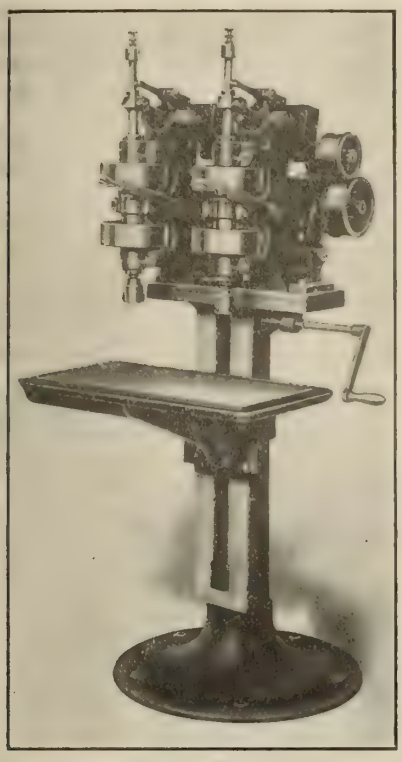
A GENERAL PURPOSE CAR TOOL.

MANY car shops, especially those largely devoted to repair work, have a good deal of cutting off, gaining and tenoning to perform, but not enough of each kind to justify the installation of separate tools. To meet the demand for a "general purpose tool" which will do all of this work, J. A. Fay & Egan Co., the railway car shop tool builders, Cincinnati, have brought out what is known as their No. 5 Large Car Tenoner and Gainer.

As a gainer, this machine will cut gains in any part of heavy timbers. It will work timbers up to 23 inches wide by 15 inches thick, and the C shaped

General purpose car tool.—The J. A. Fay & Egan Co., Cincinnati.

construction of the frame makes it possible to handle these, in all lengths. As a tenoner, it will cut single or double tenons, and if so ordered may be arranged to cut triple tenons. As a cut-off saw, it will do all kinds of heavy cut-off work, a 20 inch blade cutting-off up to 6 inches thick.



The carriage is moved by rack and pinion feed, the return movement being about three times faster than the forward or cutting movement. There is no under-estimating the value of a machine of this kind in a car shop, because of the variety of work that can be done upon it. Extra heavy construction gives the necessary strength to stand up to continuous operation.

TWO-HEAD AUTOMATIC TAPPING MACHINE.

IN the accompanying illustration is shown a recent addition to the standard line of automatic tapping machines manufactured by The Garvin Machine Co., New York City, and is known as that company's No. 1 two-head automatic tapping machine. Equipped with two heads, it practically doubles the capacity of a one-head machine, and will quickly finish pieces having two holes of different size at one handling. As the machine works automatically after the tap is once started in the work, the operator does not have to wait until the hole has been tapped, but may be busy fixing in another piece for the second spindle to work on, thus keeping both spindles busy all the time and increasing the output over that of a single head by more than 50 per cent.

Each of the spindles is fitted with two friction pulleys, driven in opposite directions by one continuous tensioned belt from an overhead countershaft, and between these pulleys, plays a friction clutch keyed to the spindle. This friction clutch is connected to a lever shown at the right of each head by a toggle arrangement, adjustable for any desired drive, and making an extra safety device to prevent breaking of taps unnecessary.

The tap is started by the hand lever and tripped and reversed automatically at any point by an adjustible screw stop on the upper end of the spindle, which trips the reversing lever at the top of

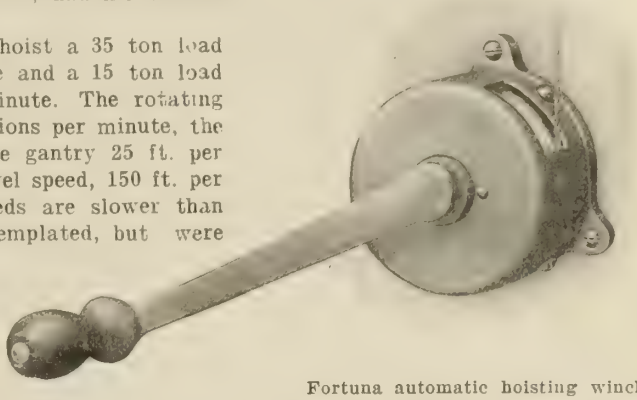
Garvin No. 1, two head automatic tapping machine.

the machine. The spindles are fitted with a positive drive chuck for holding taps. A screw motion is provided for adjusting the table, which is of generous dimensions, and has an oil groove all around it.

The machine will tap a hole 1-16th to $\frac{3}{8}$ths U. S. standard tap in cast-iron, or 1-16th to 1-4th U.S. standard tap in steel, $1\frac{1}{2}$ inches deep. The machine operates highly satisfactorily at high speed, and is reliable and safe, reducing the breaking of taps to a minimum. The operator's responsibility ends at the starting lever.

NEW TYPE OF SHIPBUILDING CRANE.

THERE has recently been installed at the Camden, N.J., plant of the New York Shipbuilding Co., a revolving locomotive type crane of large capacity mounted on a gantry, and arranged to travel backward and forward on the latter, so as to serve two sides of the pier. The design and construction provide for hoisting loads at two different speeds; the capacities being 35 tons at 20 ft. radius, or 15 tons at 68 ft. radius. The requirements of revolving, backward and forward movements on the gantry and traveling along the dock are taken care of by self-contained electric power.



A wire rope attached at each end of the gantry, and wound around a worm driven drum under the centre of the machine, makes provision for the backward and forward gantry movement. Such an arrangement locks the machine and secures against cross movement from high wind force. Travel along the dock is obtained by means of a motor placed in the centre of the gantry, and from which, power is transmitted to one truck on either side of the dock through suitable steel shafts and gearing. One motor is used for hoisting the load, and another for rotating, raising and lowering the boom, and movements across the gantry.

The machine will hoist a 35 ton load at 15 ft. per minute and a 15 ton load at 30 ft. per minute. The rotating speed is two revolutions per minute, the movement across the gantry 25 ft. per minute, and the travel speed, 150 ft. per minute. These speeds are slower than was originally contemplated, but were found desirable on account of lack of available power. The hoist motor is operated by an electric dynamic brake, and electric power, 220 volt, D.C., is delivered to the machine by means of a third rail along the dock, across the gantry, and below the rotating frame.

The machine was designed and built by the McMyler Interstate Co.

THE FORTUNA AUTOMATIC HOISTING WINCH.

A USEFUL device has recently been put on the market by the Fortuna Machine Co., Leicester, Eng. The illustrations give a general idea of this hoisting winch, which can be used for lifting or lowering electric lamps, gas and oil lamps, shutters, blinds, etc. It is made in four standard sizes, capable of handling loads from 50 to 100 lbs., according to size, but may be had of larger capacity if required. The winch can be fastened to the outside of a building in an exposed position, being unaffected by weather, as the mechanism is enclosed. Simple in construction and perfectly reliable, it cannot be tampered with, and is therefore "fool proof."

Fortuna automatic hoisting winch.

To raise or lower the load, it is only necessary to insert the stem of the handle and turn it one way to raise or the other to lower, and at whatever point the handle is withdrawn or stopped, the winch automatically, with elastic grip, holds the load firmly and immovably in position. The gripping force is increased with the weight of the load.

This winch is being handled in Canada by Francis Hankin & Co., 230 Coristine Building, Montreal.

New type of shipbuilding crane.—Makers, The McMyler Interstate Co.

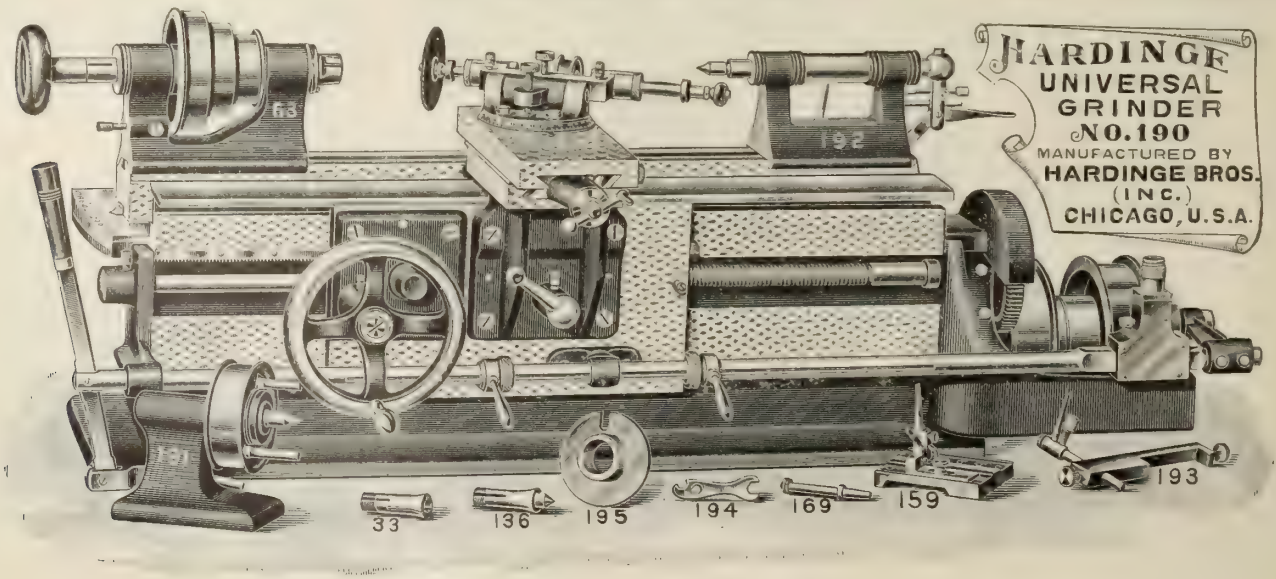
HARDINGE UNIVERSAL GRINDER.

THE Hardinge Universal Grinder No. 190 represents 30 years of practical experience applied to designing a machine that is suitable to do all manner of internal and external grinding in a practical way. Referring to the illustration, there will be seen at the left a steel plate inserted in base of the machine which is graduated to 10 degrees on either side of the zero line. The plate is a 20 degree arc of a circle, 36 inches diameter, therefore fine readings can be readily observed. Changing the bed to different angles is accomplished by unlocking two hand nuts, easily reached from the front of machine. The bed is designed to carry Hardinge Patent Bench Lathe Heads, sizes 3 to 7 inclusive, the spindle and journals of which, being protected with felt rings and dust caps, absolutely prevent emery or cutting material of any kind from coming in contact with the bearings. By the use of the Hardinge Patent Bench Lathe Heads, in connection with the grinder, one is enabled to use draw-in chucks, wheel chucks, face plate, universal or independent-jaw chucks.

The illustration shows the other attachments, namely, No. 191 dead centre head, No. 139 finger for supporting teeth of straight face cutters while sharpening, and No. 193 for supporting teeth of spiral cutters, also while sharpening. The traverse spindle is hardened and ground, and runs in adjustable journals, which are protected with felt rings in a similar manner to the bench lathe heads. In each end of the spindle is a standard taper hole, so that the wheel may be used at either end. The spindle head is graduated to 360 degs., therefore any angle is easily secured. The slide, upon which the grinder head is mounted, is the three-slide style, enabling the operator to move the wheel to or from work rapidly, while fine feeds are attained through the use of the index slide.

The power feed is constructed so that the operator may change lengths of cuts immediately, and may also obtain a micrometer adjustment through the use of knurled nuts on feed control stops. For hand operating, it is necessary only to release the split nut, and use hand wheel. The countershaft is arranged to get a variation of speeds, and is constructed so that the work, emery wheel or both, may be stopped independent of the main drive.

Hardinge Bros., Inc., 3133 Lincoln Ave., Chicago, Ill., are the makers of this Universal Grinder.



COMBINATION CENTRE DRILLS IN SETS.

THE J. T. Slocomb Co. are putting on the market their combination centre drills in sets. Heretofore, it has been possible to buy these either in boxes containing a dozen of a size, or else singly. The Slocomb Co. realize that in a great many shops it is worth while having a centre drill of each size so as to take care of any work that might be coming along. In some factories where centre drills are used extensively, such sets may not be of interest, but to those making a variety of product in which centreing is not the all important part, they are an advantage to the workmen, as the latter have not then to run about in order to find the right tool when necessity arises. Then, too, nearly every machinist has his own tool-chest of tools, and these sets enable him to have a centre drill which he can use in emergency. Each set is put up in a nicely finished and attractively got-up wooden box.

To-day, centre drills are used in almost every shop, and a great many manufacturers include these items in their list of tools. The J. T. Slocomb Co. have devoted a great deal of time and study to the making of these tools, so as to get the proper shape, size, material, etc. Some little time ago, they started making these drills of semi-high speed steel, and everyone made to-day is of that material. This is quite an important point, for they have been able to prove that the semi-high speed steel combination centre drill will do more work than the carbon steel drill.

Full information regarding these new sets, etc., may be had by addressing the J. T. Slocomb Co., Providence, R.I.

Vol. VII. December, 1911 No. 12

THE McNAMARA CONFESSION.

HUMANITY in unit and mass has always been subject to violent shocks and upheavals, and while each blow finds a definite mark or location, the effects felt, and warning administered, radiate to and embrace usually a much wider sphere. The McNamara confession will, we doubt not, have a salutary result in not only eliminating the destructive element in organized labor, but discourage the enactment of measures on the side of capital which have been many times both inhuman and unprincipled.

Organized capital and organized labor are permanent institutions, each having a part to play in the world's civilization and industrial development, and the McNamara episode is, we believe, the death-blow to coercionists and desperadoes within their ranks, whose misguided zeal and poverty of common sense has hindered that closer agreement and mutually beneficial understanding, so much desired.

ACHIEVEMENT THE TRUE MEASURE.

THERE is a growing tendency, particularly in our industrial organizations, to have one man or one set of men do the "thinking" part of the business and another or others perform the working or operating. Such a caste distinction is no novelty, as in every sphere, domestic, social civil, industrial, political and religious, there has always existed, and of more or less necessity perhaps in the past, this conspicuous feature. Benefits have accrued from its practice, but side by side, and more pronounced as education and intelligence have become better diffused, there has naturally arisen a resentment to a continuance or increase of its scope and display.

We are apt to forget that brains are no monopoly, that an overwhelming majority of their possession belongs to the operating departments of practically all enterprise, and that development of their possibilities, too long conserved and hidden, is making rapid strides towards being a factor of supreme importance. The disposition to limit breadth of thought in a majority, and require them to concentrate on circumscribed fields of operation, is a short-sighted and ultimately disastrous policy. Co-operation of different trades, in the manufacture of any product, is a wise and efficiency-attaining arrangement to be developed and cultivated, but the system, which prohibits a man from being a master of his art, is retrograde and selfish in its aim. Technical, industrial and university education are each contrary to the ideal which would make the employe simply an operator, and represent time and money expended needlessly, being, as they are in such cases, more of a hindrance than otherwise

Sufficient appreciation, is wanting, of the unrest sure to arise from the monotony of expertness acquired only by restricted scope and outlook. Inefficiency is always the result of unrest, and unless a man has within himself the satisfaction of something tangible achieved beyond its cash value, and is conscious of a like rating in estimation by those whom he serves, this inefficiency will prevail in spite of the myriad combating systems so prominent to-day. The trouble is—that some men are ready, without thought or consideration, to accept conditions which will annihilate their personality and bring them increased returns, and others again are willing to put such schemes into practice, also with a view to profit. How many, we ask, either of the instigators of these yellow metal systems, or of the great body of those who are intended to come under their scope, can on sober reflection, say that the scheme is as philanthropic and far reaching in its benefits as is represented?

We are all conscious that two clearly defined sections of personality exist in the world:—Labor and Intellect. We are also conscious that their representatives are known as the "operator" and "thinker" respectively, and, further, that one is a workman and the other a gentleman. Did it ever occur to you that such a condition is prolific of inefficiency, and breeds envy and discontent in spite of increased remuneration offered by a system? Again, it needs no microscope to perceive that too little work forms part of the "thinking" section, and too little "thinking" or opportunity for its exercise is in evidence among those dubbed workmen. Someone has said "that the mass of society is made-up of morbid thinkers and miserable workers, each more or less at enmity with the other."

The nature of our employment, whatever it be, calls for much less pride than we are prone to take, and demands, instead, that we put excellence of achievement as the true measure, not only of our important selves, but of those others whose field lies in a different groove. All of us need the opportunity and should have the encouragement at our daily task whatever it be, to think as well as work constructively, and the more persistently this is practised, the less will be the suspicion attached to the motive behind innovations and the harder to determine caste in industry's ranks.

MOLDING A GLASS POLISHING ROLLER IN LOAM.

By John H. Eastham, Montreal.

THE following method of molding a heavy roller in loam, for plate-glass polishing purposes, may perhaps interest readers of "Canadian Machinery." This casting was required exceptionally clean and bright, and of as hard a close-grained mixture as was compatible with easy machining. When cleaned, it weighed approximately six tons. Two sets of arms, six in each set, were considered advisable, the casting being nearly seven feet across the rim, and of same design as a double armed pulley.

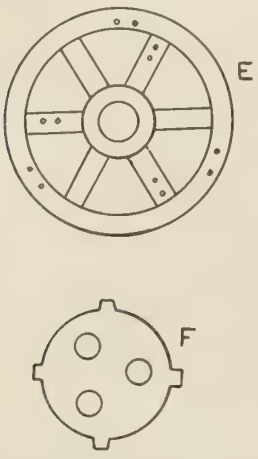

Fig. 2---Molding a Glass Polishing Roller in Loam

Detail of Procedure.

On a heavy base plate, marked A in sketch of completed mold, Fig. 1, a course of bricks was laid, and a sloping parting made at B.B. The core was next swept-up to height required for formation of first hub and set of arms. A plate, indicated at C.C., was bedded one course of bricks below the hub, to secure solidity, considerable pressure being anticipated at this point. A small strickle swept-up the hub, and the first set of arm cores were placed in position. The correct depth shown by an arm or gauge is attached to the main sweep. After bricking-up to the top of the hub, a parting, shown at dotted line, D.D., was made, and the plate E, provided with three long eyes for lifting purposes, bedded to place. The core was next built and swept-up to the second set of arms, and the process of sweeping-out the hub and placing the arm cores repeated. A small plate shown at F, fig. 2, perforated for three runners, was next swept-up with loam to cover this hub, and the core built up to its full height; the inside being left open to facilitate ramming round the gates when closing, and inserting the hub core after drying. The core, being now completed, was allowed to stiffen, whilst the outside of rim, or "cheek" was swept-up, a single course of bricks being built-up on a ring-plate provided with four lugs for hoisting purposes. A tapered parting was made to match the one at base of core, to ensure a good fit and even thickness when closing the mold.

Both parts were blackwashed before stoving, and then placed on the stove car. The core was separated at the parting over lower hub, to guarantee the inside being thoroughly dried. After one good night's firing, the base plate with inside section was lowered into the large casting pit provided for deep molds, the core being placed in the lower hub, and top section lowered to position. The cheek was next lowered over the whole, the top hub core inserted and covered with the small plate F. The gate pins having been fitted into this plate, the inside was rammed-up to the top with floor sand, the crown plate lowered to place, and runner and riser boxes lined up as shown. Cribbing plates of ordinary type were fitted round the job its full depth, the space between them and the brickwork of the rim being rammed-up tightly to prevent all strain.

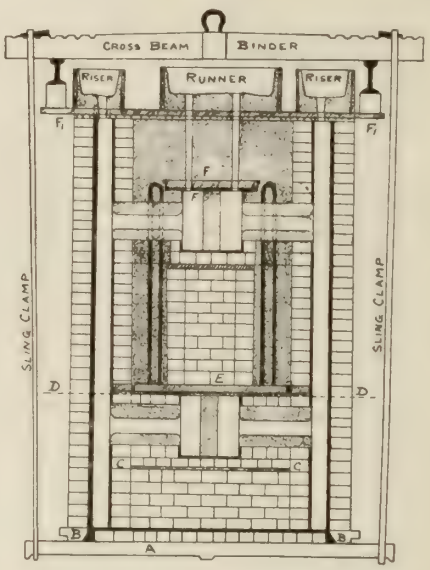

Fig. 1---Molding a Glass Polishing Roller in Loam

A cross-beam clamped down to base plate by sling clamps at four points held the whole mold firmly in position. Feeding was considered unnecessary; one inch of depth added to the rim, to be machined off afterwards, and the heavy risers being ample allowance for shrinkage. There is, no doubt, from the writer's experience, that castings similar to this in depth and general design, give the best results when made in loam; the cost of rigging being about the same, the actual molding time perhaps a little less, and the risk of loss certainly lower, than when made in sand.

Fitting Pipe Templets

(By Joseph Horner, Bath, England.)

FOR a puzzling drawing to make or read, one of the pipe plans for marine engines is hard to beat, the lay-out for ordinary engine houses, factories, water works, gas works, etc., being rather simple by comparison. In all drawings of this kind, the directions of pipes can generally be indicated correctly, but the actual measurements of the lengths of many of them cannot be determined by the draughtsman. The reason lies in the awkwardness of the various bendings and angular relations of pipes and flanges.

When pipes are of copper or of wrought iron, these materials lend themselves readily to corrective settings in bends and flanges, but with cast iron pipes, such settings are not possible. In each case, the main pipes are usually first made and fixed in place from the drawings, but the "make-up" lengths are prepared from templets fitted into the lo-

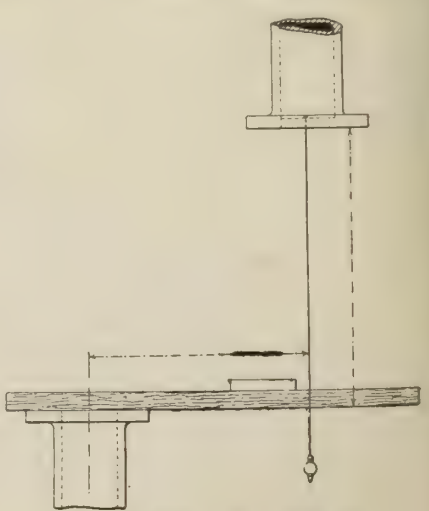

Fig. 1—Fitting pipe templets.

cations that the actual pipes will occupy. In many instances, these have to be curved to fit around parts of machines, or around other pipes, the curving being sometimes in more than one plane. Flanges, too, are often set slightly out of square, or at a considerable angle. Again, pipes may have branches set square, or at some acute or obtuse angle, and frequently the working-in of standard wrought-iron pipe fittings has to be provided for.

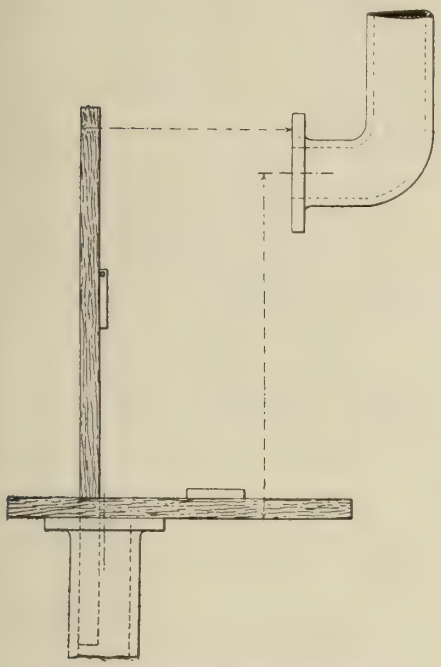

Fig. 4—Fitting pipe templets.

In cast iron pipes, the templet often includes the thickness of metal and the positions of bolt holes. When the work is done away from the shop, the templet must give all that the patternmaker or moulder or machinist requires in order that the finished pipe or pipes shall go into place and be bolted up at once. The foregoing observations hold good also in relation to repair and jobbing work, such as when alteration in the directions of existing pipes, or extensions, have to be made. Some illustrations, therefore, of the methods adopted in making these templets may be of utility.

Templets are made of wood or iron, the first usually, though not of necessity for cast-iron pipes chiefly; the second for pipes of copper or wrought iron. In each case the templets must retain their shape permanently, for if they don't the work done according to them will not be accurate. Nothing must be permitted to shift, and nothing must spring, therefore, rigidity and firmness are essential. We will consider the two kinds of templets in succession.

Templet Dimensions.

Before fitting a templet into place, dimensions are, if possible, taken overall between flanges, or from the centre of one pipe to the face of that with which it has to connect. How this is done depends on the relationship of the pipes. Usually, the aids employed besides a rule are the spirit level, the plumb bob, the parallel straight-edge, and the plumb line, or plumb rule. Distances may be taken in the manner shown in figs 1 to 4, which are typical of numerous cases.

Fig. 6—Fitting pipe templets.

In fig. 1, two pipes have to be connected by a diagonal pipe, or an S-bend. The distances of flanges and centres are taken in the vertical direction from a parallel straight-edge laid in the bore of one, and set horizontally with a level, and in the horizontal direction from a plumb line hung from the face of the flange, or from a straight-edge set vertically from the lower flange as indicated in dotted outline.

In fig. 2, measurement may be taken from the straight-edge to the face of the flange for vertical distance, and for the horizontal, from the centre of the plumb line to the centre of the flange as shown.

In fig. 3, a plumb rule is dropped, from the vertical flange whence measurement is taken, to the face of the other, and the vertical distance is taken from a straight-edge in the bore of one pipe to the centre of the other. In fig. 4 straight-edges alone are shown as aids to measurement. When dimensions are taken thus, the templets are prepared by one of the methods mentioned, as seems most suitable, and the exact fitting is done between the flanges, using a plane to effect the corrections on the faces of the latter.

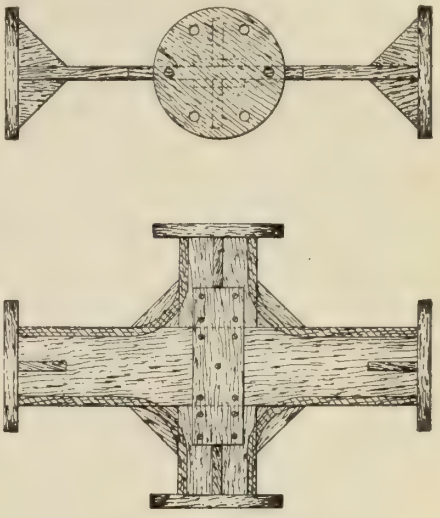

Fig. 8—Fitting pipe templets.

Cast Iron Pipe Templets.

Wooden templets comprise the stem or body, and the flanges (or spigot or socket in some cases.) The stem may be a mere strip, or it may be made wide enough to represent the outside diameter of the pipe, on which also the bore may be marked. Unless it is desirable to have these particulars, a narrow strip will serve the purpose as well as a wide one, its function being to give the correct positions of the flanges in regard to distance over all, and their fitting against the flanges with which

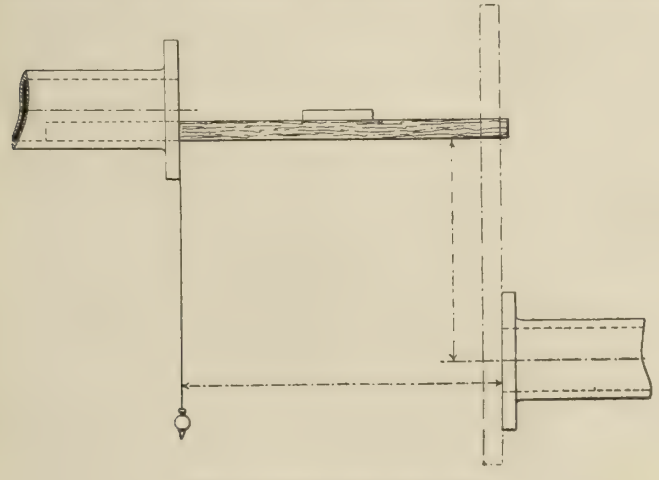

Fig. 2—Fitting pipe templets.

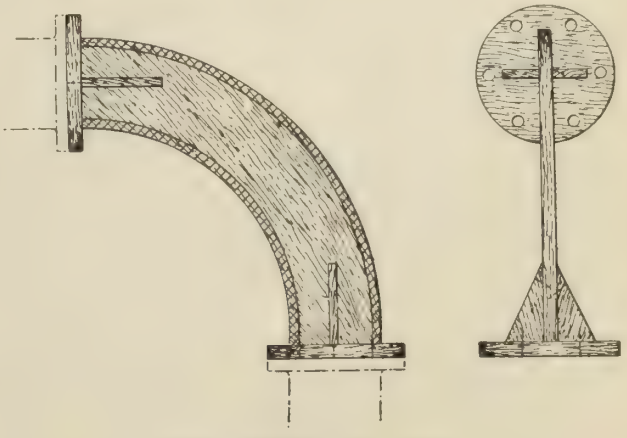

Fig. 5—Fitting pipe templets.

they make contact, either square or at some angle.

The material used ranges from $\frac{3}{8}$ in. to $\frac{3}{4}$ in. thick; white and red deal or yellow pine being suitable. The flanges are sawn to the circle with a band saw, and nailed or screwed against the ends of the stem portion. To prevent them from shifting, brackets are nailed or screwed both to flanges and stem in the manner shown in the various figs. The templet is thus rendered rigid as a whole. Slight final corrections of the flange faces will probably have to be made with the smoothing plane since the fit here must be exact. Bolt holes are marked through from the existing flanges to the templet, and either left as marked, or bored with a centre-bit.

Fig. 5 shows a templet for a bend pipe with bracketed flanges, bolt holes marked or bored, and with the thickness of the metal indicated. Fig. 6 is a bend templet formed of two strips halved or simply placed one on the other, and screwed together. On this the radius on the centre line is stated, and the outer one is, of course, struck from the same centre as the inner. The thickness of metal is also stated. In fig. 7 the radius of the throat of the branch is drawn, and the thickness of metal marked. In the tee-piece fig. 8, the same particulars are entered.

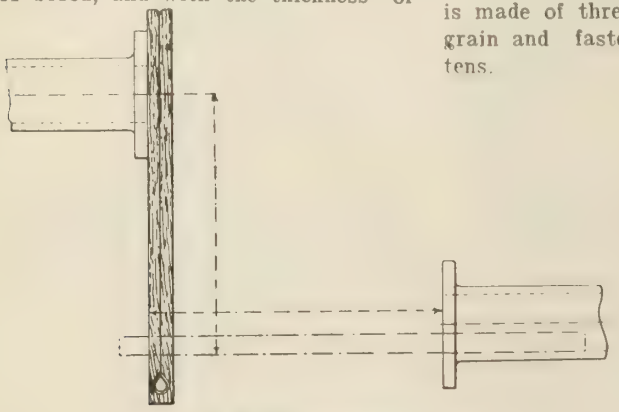

Fig. 3—Fitting pipe templets.

Figs. 9 and 10 show how the strips of templets for connecting pipes can be united with battens. These do not necessarily give the shapes of the pipes between the flanges. They may be of combined bend and tee form, as in fig. 9. In fig. 10 a double bend or an S shape may be adopted. Fig. 11 would be an S pipe.

Fig. 9—Fitting pipe templets.

The patternmaker should write on the templet all particulars of this kind, and strike out the actual shape on a shop drawing board. Fig. 12 shows a templet for a Y pipe connecting three pipes. It is made of three pieces to avoid short grain and fastened together with battens.

Fig. 13 illustrates the templet for a socketed-branch pipe, with the curves of the throat and the thickness of metal marked everywhere. Fig. 14 shows how a templet for a Y-shaped pipe may be fitted to a socketed pipe and to two spigoted pipes, after which the thickness may be marked on the templet, or simply stated in writing. Actually, the fitting to the socket and spigots determines all the dimensions, since these are standardized in all such work.

When pipes fit around vessels or round other pipes, it is essential to cut the stem portions to the shapes and dimensions of the castings, fig. 15, otherwise, the pipe, when made, may foul existing erections. There is a large percentage of such cases in pipe fitting, and diagonal pipes must often be dealt with in like manner to secure clearances.

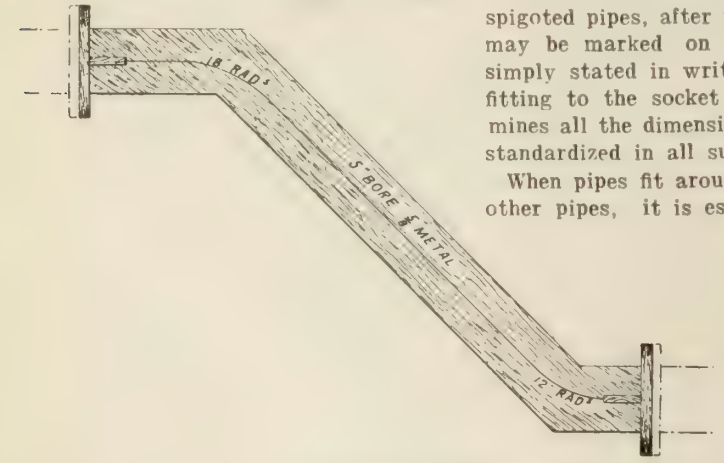

Fig. 11—Fitting pipe templets.

A careful man will mark the thicknesses of metal cross-hatched, as illustrated in several of the diagrams. This is not only helpful to the patternmaker, but also to the moulder in some cases, for as work of this kind is not of a set or standard character, it has to be done with make-up pattern parts, or in the larger pipes, swept up in loam with strickles. The templet, then, being sent into the foundry with the strickles, serves as a reference and guide to the core-maker and moulder. The same templet also goes afterwards into the machine shop as a guide for drilling the bolt holes. Finally, the templet may be kept in the stores for future use if the work is likely to be repeated, or repairs or spare parts wanted, though as a rule it is broken up after it has served its purpose.

Copper and Wrought Iron Pipe Templets.

Templets for copper and wrought iron pipes are usually made of iron rod to which sheet iron flanges are riveted, fig. 16. The rod must be large enough to be rigid, being usually $\frac{3}{8}$ in. or $\frac{1}{2}$ in. square. When that is not rigid enough, wooden templets are made, although seldom necessary. Less exactitude is required in these templets, because copper pipe admits of a considerable amount of corrective setting and bending, and wrought iron pipes only in a slightly less degree. In the latter, the make-up is often done with elbows, springs, sockets, and other fittings which admit of a fair range of adjustment. Also, in this work, flanges are brazed to copper and screwed on

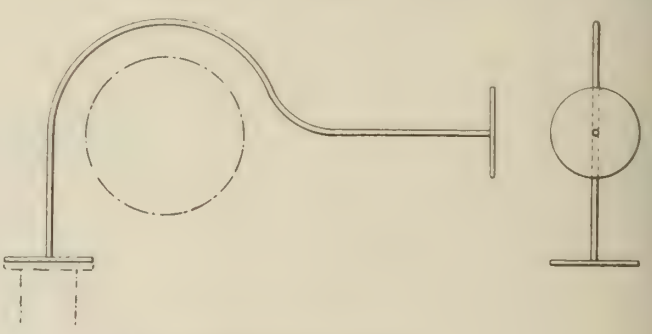

Fig. 16—Fitting pipe templets.

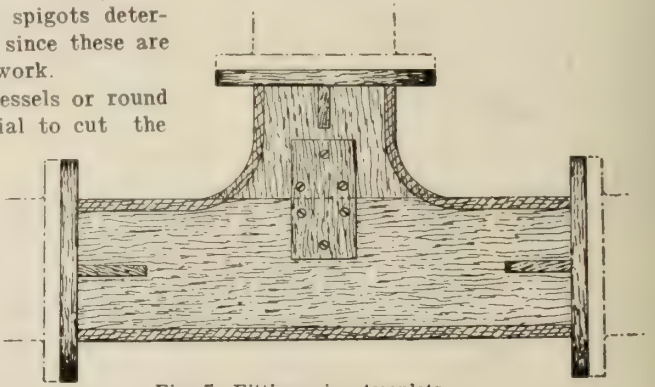

Fig. 7—Fitting pipe templets.

iron pipe, circumstances which again aid adjustments somewhat.

Transferring Measurements.

When transferring dimensions from templets to pipes or pipe patterns, either right or wrong methods may be adopted. It is not usually sufficient to lay the pattern and templet together, though that is done for a final test. Centre lines and flange faces must be worked from, hence, a patternmaker lays down centre lines on the stem of the templet, starting from the centre of the flanges. In iron templets, this need not be done if the iron stem occupies the centre of the templet.

Another method, which is available in either wood or iron templets, is to take measurements from centre to faces of flanges, the face of one flange being laid on the marking-off table. This is perfectly accurate. The measurements can be transferred to the casting by lining-off, and be checked again after tooling.

Drilling Bolt Holes.

Care has to be exercised in drilling bolt holes. One should not assume that they start on a centre line as they may

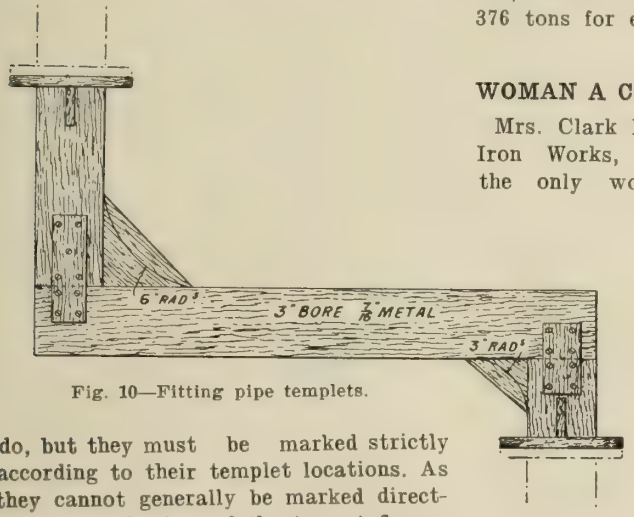

Fig. 10—Fitting pipe templets.

do, but they must be marked strictly according to their templet locations. As they cannot generally be marked directly against the face of the tempet flange, a piece of sheet iron or a piece of paper or mill board cut to the size of the flange can be laid against the face, the holes being marked, cut out, and used to mark the casting. Slight inaccuracies will occur in these, but they are corrected by the use of a hand reamer when the pipes are put in place. Sufficient clearance is often allowed in the holes to enable the bolts to be fitted.

COKE OUTPUT.

Of the 104,440 coke ovens in existence in the United States, as per the Bulletin of the Geological Survey, at the close of 1910, 8,373 were idle throughout the year. The number of idle ovens does not include those that were idle for a

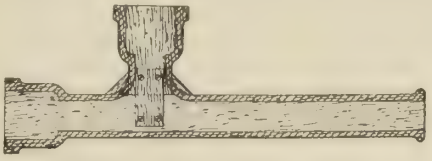

Fig. 13—Fitting pipe templets.

portion of the year only. In 1909, of the 103,982 ovens in existence, 8,501 were idle throughout the year. The number of ovens in blast for the whole or a portion of the year 1910 was 96,067, of which 92,016 were beehive or partial combustion ovens and 4,051 were retort or distillation ovens. The 92,016 beehive ovens produced a total of 34,570,076 short tons, or an average of 376 tons for each active oven.

WOMAN A CAPTAIN OF INDUSTRY.

Mrs. Clark Fisher, head of the Eagle Iron Works, Trenton, New Jersey, is the only woman member of the National Association of Manufacturers. Mr. Wu Ting Fang, ex-minister from China, called her "the most wonderful woman in America." "Though I liked machinery even when a child," said Mrs. Fisher, "it was my husband's illness and the desire which every woman has to help in an emergency that led me to enter the Eagle Works, of which Mr. Fisher was the head. I went in as the 'boss'; but I soon learned that if I was to be respected by my employes, I would have to know more than they did. To this end, I began as a regular apprentice, learned to temper steel, chisel the face of an anvil, mold vises and make rails. In fact, I took a complete course in every department of the business, from melting pig-iron to bidding for contracts. Before I was through, I learned really to love the work with iron and steel, the whir of the machinery, and the sound of the forge."

In 1902 Mr. Fisher was killed in a railroad accident, and Mrs. Fisher's life was saved only by careful nursing. Upon her recovery, she went back to her post at Trenton; and donning a loose blue working frock, she went to work to straighten out a state of affairs which would gave daunted the bravest-hearted person. Her employes had struck, the Delaware River had overflowed its banks, the shops were flooded, the machinery was rusting, and everything was in a state of confusion. Using great tact, she persuaded the hands to return, and set the factory to rights in short order.

Mrs. Fisher's business acumen was shown when she outbid all male competitors for the contract of furnishing anvils and vises for the Panama Canal

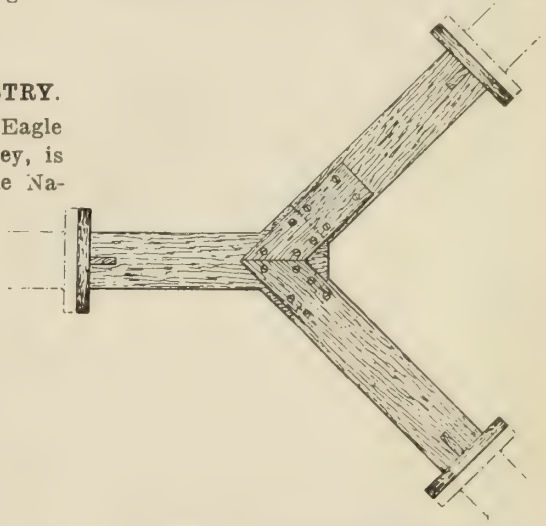

Fig. 12—Fitting pipe templets.

work. As a result of her untiring efforts and her ability, she is to-day a recognized "captain of industry," with a fortune mounting well up into seven figures.

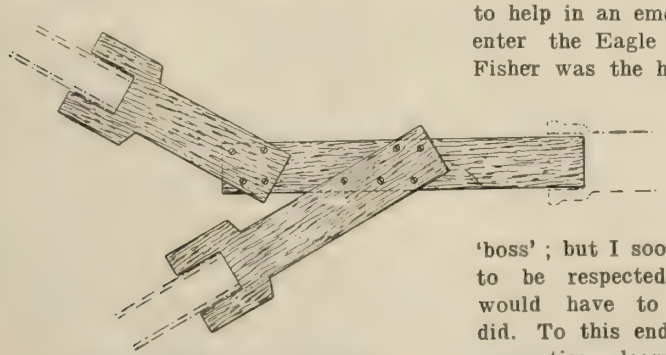

Fig. 14—Fitting pipe templets.

KNOTS AND TACKLING.

Deckhand.

TO most men engaged in manufacturing, erecting and building, has come the necessity of making a knot which will hold permanently if need be, of making a reliable but easily applied temporary connection, or of having to sling some piece of machinery for lifting or lowering to some other level. In the domestic sphere there is an oft repeated call for the exercise of "knotology," and who of us has not blundered through the work, adding knot to knot, increasing as it were safety where it is impossible to do so, wasting rope as regards quantity used, and further by cutting asunder when the package or connection wants undoing. Have you ever noted the perspiration of excitement and exertion break on the face of a novice in knots? or again, have you ever gazed with astonishment at the calm, easy and seemingly careless manner of an expert? The work of the latter takes seconds for the minutes of the former to accomplish.

The purpose of this brief article is to bring before our readers the opportunity of becoming intimate with the methods adopted in making knots.

The sketches Fig. 1 show those commonly used, each of which is simplicity in itself, easy of application and reliable in effect. They are shown open, in other words are not drawn taut, the idea being to convey the method of their formation better. As an aid to those who wish to master the intricacies of knot making, it should be a basic principle that no two parts which would move in the same direction if the rope were to slip, should lay alongside of and touching each other.

The sketches Fig. 2 show the commonly used forms of tackling, and to those having erection work to do, the various items shown and self-explanatory, will be found serviceable and safe. It is a matter of common knowledge that probably not one man in twenty can make reliable knots or rig up satisfactory tackling if called upon. The art, for such it is, does not somehow appeal to them as a valuable asset, but is looked upon rather outside their particular field, and a purely nautical necessity.

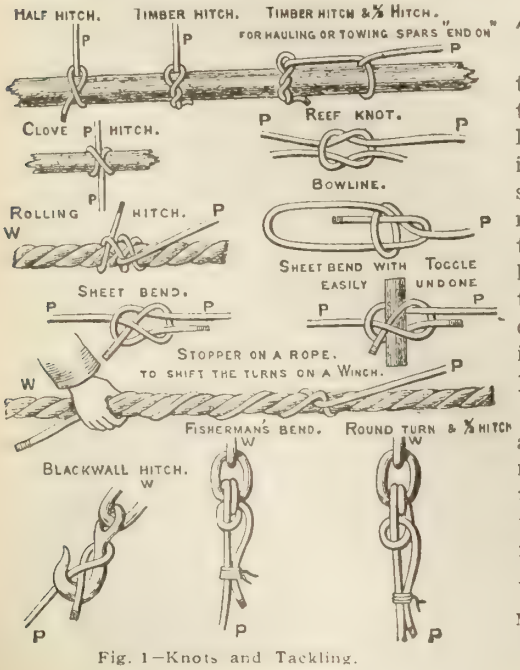

Fig. 1—Knots and Tackling.

The practice in many instances is to employ a ship rigger or sailor to care for lifting, knotting, tackling and slinging required. The opportunity to learn is well worth taking advantage of by everyone, particularly as the means of experimenting, a few feet of cord, and the leisure to do it, are within the reach of all.

To the onlooker the artful manner in which an expert does his work, gives rise to the impression that the operation is too simple to be effective, and he fears the dire results that are sure to follow the particular effort being carried out. The idea that knot upon knot, twist, half hitch and loop need be multiplied to give quantitative appearance, dies hard.

Simplicity in most cases commends itself, being more economical and surer in results. Knotting and tackling call for the utmost simplicity, just as much and possibly more so than most things, but to attain that desired end, a more general cultivation of familiarity with them should be considered an essential part of every man's brain and hand equipment.

NORTON COMPANY'S MEDICAL DEPARTMENT.*

By Dr. Irving Clark **

THE Norton Company established its medical department during the latter part of May, 1911. The step then taken was the outcome of two ideas:—First, that a medical department would increase the efficiency of the employees; second, that it would increase the already well-marked good feeling between the men and the company. As the belief, that increased efficiency may be obtained by caring for the physical condition of employees, is somewhat new, its basis will be sketched.

Health a Factor in Labor Efficiency.

In the consideration of production in any given department, practically every mechanical item can be accurately estimated. It would be possible to figure the exact cost and output of any department, provided that all the work in that department, even to the minutest detail, were done by machinery; that is, provided that the human element could be eliminated. It is this human element which cannot be accounted for and which, therefore, should be given very close attention.

To obtain maximum results, for the work at which it is engaged, the human material must be maximum quality, and maximum quality in factory employees means perfect physical health. The problem of health, therefore, assumes a new proportion in considering efficiency, and we might say that if every man employed were physically well, all departments would run with the utmost smoothness and production. To produce such an ideal condition is of course impossible, but an approach to the ideal is quite possible.

System of Investigation of Health Problem.

In an attempt to investigate this problem the following steps would seem rational, and have been adopted by the medical department.

1.—Complete physical examination of all employees.

2.—Immediate attention to all defects found at examination, and an effort made to rectify same.

3.—Re-examination at regular intervals of employees having physical defects, to see that they are in the best condition possible.

4.—Immediate attention to all employees incapacitated by injury or illness, and an effort made to get them into normal condition in the shortest time.

Anticipated Beneficial Results.

The practical results of such a plan if systematically carried out should be as follows:

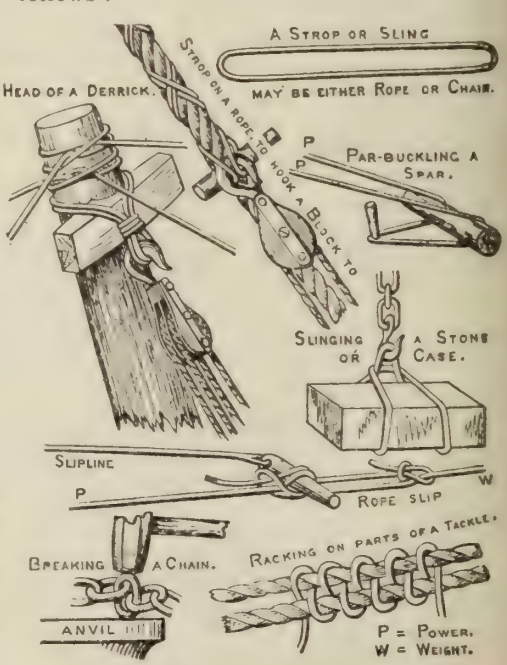

Fig. 2.—Knots and Tackling.

* Abstract of paper read at the National Machine Tool Builders' Convention, New York.

** Norton Company's medical department.

1.—Immediate elimination of those absolutely unfit for work.

2.—An increase in the capacity of the partially unfit by slight changes in work, medicine, mode of life, etc.

3.—An exact knowledge of those who may become partially or wholly unfit, and a continued effort to keep this from occurring.

4.—A prevention of sickness by advice given to well employees and by immediate attention to slight ailments.

5.—(a)—A reduced time of recovery from accidents. Wounds and injuries properly treated at once heal very much more quickly than if treatment is delayed.

(b)—The elimination of so-called blood poisoning, by proper treatment of wounds.

6.—The elimination of active tuberculosis, syphilis, or any condition dangerous to other employes.

The outfit and method of the medical department in its effort to carry out this plan, and the results up to the present time, are as follows :

The Hospital.

This consists of a room of moderate size, well lighted and ventilated by two large windows, and having a carefully selected equipment. It contains a desk, an instrument cabinet, a glass-top table for dressings, a sterilizer for instruments and dressings, and an examining table. Beside this, there are numerous solution bowls, instruments, dressings, etc. In short, it is a minature dispensary.

Tho Physician.

The doctor gives about three hours a day at the factory ; about an hour and a half in the morning and the same length of time in the afternoon. In the morning he examines all sick employees applying for treatment, and either prescribes for them, or, if they are sick enough to have to stop work, advises them to call in a physician. In the majority of cases, however, the men have minor ailments, which readily yield to simple treatment. The afternoon is devoted almost exclusively to making physical examinations.

Functions of the Medical Department.

These are three in number :

1.—The care and after treatment of all accidents occurring to employees.

2.—The complete physical examination of every employee, and an attempt to remedy all existing physical defects.

3.—The examination, diagnosis and advice of all employees complaining of any sickness whatever.

These three functions considered in detail, show what has been accomplished.

Care of Accidents.

Despite a committee of safety which is continually introducing new methods of prevention, a large number of accidents are bound to occur in any large factory.

In the majority of cases, if these accidents receive prompt and efficient care, they prove merely an inconvenience to the employe, perhaps preventing his work for 48 hours, but seldom longer. Even the smallest wound or scratch, however, if it becomes infected, may lead to a long and sometimes serious illness. Therefore, prompt attention and thorough cleaning of all wounds become a matter of prime importance.

It is also important that an employe receive immediate attention by some one in the department in which he is working, and that he be removed as quickly as possible, in order not to break up the work of other employes. Bearing these facts in mind, the Norton Company devised the following method :

Once a week for ten weeks, all the foremen of the different departments were called together, and the doctor gave a thirty minute talk upon the various accidents most frequently met, and their immediate treatment.

The subjects lectured on were as follows :

1.—Hemorrhage and its treatment.
2.—Burns and bruises.
3.—Lacerations and cuts.
4.—Sprains.
5.—Fractures and dislocations.
6.—Infections (blood poisoning) and treatment.
7.—Resuscitation from gas, fainting, etc.

Each lecture was made as simple as possible, and was illustrated by blackboard drawings and actual demonstrations, such as putting on bandages, splints, etc. At the end of this course of lectures, an oral examination was held, and since then, there have been examinations and conferences about once a month. The foremen have shown great interest in this part of their work, and have ably demonstrated their ability to apply the principles they have learned. At the present time, the foremen are coming three at a time to the doctor to put on bandages under his supervision.

Each foreman is provided with a first aid jar containing

Three bandages of different widths.
One package of sterile gauze pads.
Three finger splints.
One tourniquet (rubber).
One measuring glass.
One bottle of aromatic spirits of ammonia.

The jar has general directions on the outside, and there is, in addition, a card of first aid directions posted in each department.

When an employee is injured, the following is the routine :

1.—Foreman administers first aid and notifies main office.

2.—Main office notifies doctor and trained dresser.

3.—Patient is conveyed to the hospital, where dresser prepares case for doctor's examination and treatment.

4.—Doctor arrives at the hospital and cares for the case.

All cases of foreign body in the eye are cared for by the doctor in person. When the body is a particle of steel or Alundum, which has penetrated the clear part of the eye, the eye is dressed and the patient sent immediately to an occulist for operative removal. Unless treated with the greatest care, these cases are apt to result in permanent injury to vision.

While our system for caring for accidents has not been in force long enough to make any statistical statement, we can say that no clean injury has become septic, and that no employe has been obliged to be absent from work more than a week, except two very severe eye cases. In the majority of cases, the patient has been able to return to work immediately after treatment.

The type of injury met at the factory may be seen from the following list, which is of the injuries received during the past three months :—Wounds, 28 ; crushing injuries, 11 ; sprains, 5 ; foreign body in eye, 13 ; miscellaneous, 14.

An examination of these statistics shows that, while there are practically no serious injuries, there are many which if not properly cared for, may lead to considerable loss of time. By the method outlined, all injuries receive prompt and efficient attention, and subsequent dressings are done by the doctor until the patient is entirely cured.

Physical Examination of Employes.

The physical examination of employes is rather a new departure, but to our minds is the corner stone in building up physical efficiency. Each employe receives a complete physical examination, for we believe that, unless a physical examination is so, it is of little value, because impossible to foresee where weakness may appear which will have a definite effect upon the employe's efficiency.

Each employe is, therefore, examined carefully for defects in all organs, and the results entered upon a card. Any abnormal condition of the chest, back, or abdomen, is charted on the card diagram.

After examining a man, the doctor discusses his physical defects with him, and strongly urges him to attend to any weakness. Thus men having ruptures are advised trusses. Those with poor teeth

are advised to go to a dentist, and all are instructed in the importance of care of the teeth. If any minor disease exists, advice is given, with prescriptions if necessary. The employe is told to report again in two or three days as the case requires. Where there is reason to suspect pulmonary tuberculosis, a sputum examination is made, and where the kidneys are suspicious, a urinalysis is done. We expect to make a complete urinalysis on all employes over 40 years, but have not started this work yet. If the employe examined is too sick to work, he is sent at once to his family physician.

It will be seen from this that every attempt is made to get the men in perfect physical condition to start with. But this is not all. When an employe is found to have a weak heart, and is doing work injurious to that heart his work is modified. When a man has a double rupture he is not allowed to do very heavy lifting, etc. Men found having organic disease are required to report at varying lengths of time for examination and advice. In this way, the weak spots of the human machinery are kept under close supervision, and any rapid degeneration prevented.

Results Encouraging.

The results of this side of the work have already been most encouraging. The men take a great deal of interest in their personal condition, and are quick to appreciate the relief afforded by the simple remedial measures adopted. We have had but one objection in the course of six hundred examinations, and the majority of men thank the doctor on leaving the hospital. When a man has once been examined, he is pretty sure to return for advice at his first subsequent sickness.

By his examinations and subsequent intercourse with the employees, the doctor is able to get in very close sympathy with his patients, and they discuss many things with him freely. He is thus able to use his influence to prevent the minor vices, such as over-smoking and late hours among the younger men, and, in several cases, has had very gratifying results in his efforts to keep valuable men at steady work who have a tendency to "sprees." Working men will listen to advice from a doctor, and what is more, follow it, when from anyone else it would prove of no avail whatever. The moral power of the doctor must necessarily become greater as time goes on, and the men become more and more convinced of his good faith and interest in their physical welfare. The defects found have been divided into three classes—Medical, Surgical and Special sense, and total, 113, 209 and 276 respectively.

We now come to the third function of the medical department which consists in examining and advising all sick employes.

Dispensary.

Previous to the establishment of the medical department, a sick employee saying he was unable to work was allowed to go home. Now he must apply to his foreman, and is then sent to the hospital. There the doctor examines, advises, and prescribes for him. Often it is found that one of the simple remedies which are used at the hospital, will give such immediate relief that the man is able to return to work. If, on the other hand, a really serious condition is discovered, the man is sent home, his physician notified, and everything done to get him under proper care at once.

In connection with the dispensary the foremen are provided with "sick slips," which they fill out in all cases of injury or sickness, giving the date of absence from the factory, and the number of days or hours of lost time. These are filed by the doctor, and the length of absence and cause noted on the original examination card. When the man has left the factory without seeing the doctor, he is sent for on his return, and the cause of his absence obtained. This is then noted on the "sick slip."

All physical examinations are filed by name, and two lists are kept, one of normal men, the other of those having defects. By this system the exact physical condition of each employee is known, as well as any sickness or accident he may have had; and the length of time he has lost by each. By turning to the "sick slip" file, the number of cases of sickness or accident in any department may be immediately seen, as well as the names of the men, the disease or accident causing the absence, and the amount of time lost.

The dispensary function of the hospital is growing in popularity among the men, and it is hoped that the intercourse between doctor and employes will promote additional good feeling between the employes and the company.

The medical cases which have been treated during the past three months number 63.

In closing, we would have it distinctly understood that this is only what would be termed in medical parlance a preliminary paper. The work has been going on only six months, and the development has naturally been slow. It will be several years before statistics can be obtained to show whether or not efficiency has been promoted. However, as far as we can judge from the small amount of data at hand, there is good reason to hope that ultimately a high degree of physical efficiency may be achieved, as well as a closer sympathy between the employes and the company.

U. S. COAL PRODUCTION IN 1910.

The coal mines of the United States were credited in 1910, with an output of 501,576,895 short tons of anthracite, bituminous coal, and lignite. This great output was attained in spite of the fact that most of the coal mines in Illinois, Missouri, Kansas, Arkansas, and Oklahoma were closed for nearly six months by one of the most bitterly contested strikes in the history of the industry. The greatest tonnage mined in any other year was in 1907, when a total of 480,363,424 tons was produced. Compared with 1909 the output last year showed an increase of 40,762,279 tons, or nearly 9 per cent. This increase was equal to 20 per cent. more than the entire output of the United States in 1870.

GROWTH OF ENGINEERING SOCIETIES.

The statistics of the important engineering societies of the United States and Canada show that the growth of the four principal engineering societies in the past five years has been as follows: —American Institute of Electrical Engineers, 7,118, an increase of 3,524; American Society of Civil Engineers, 5,976, as compared with 3,569 members in 1906; American Institute of Mining Engineers, 4,200 instead of 3,886; and American Society of Mechanical Engineers, 3,899, an increase of 970. Five years ago the American Institute of Mining Engineers was the largest society of the four, but it has receded to the third place, its increase being the smallest of the four, only 314. The National Electric Light Association has increased its membership by about 1,000 in the past few months; it had 923 members in 1906, and now has over 9,000. The American Iron and Steel Association is credited with a membership of over 200 corporations and companies, the American Iron and Steel Institute with 315 members, the American Museum of Safety with 100, and the American Society for Testing Materials with 1,350 members.

One of the features of the statistics is the increase shown in the number of State engineering societies, and of sanitary engineering and water supply associations formed during the past five years. Among the more prominent new societies formed in that period are the American Institute of Chemical Engineers, American Institute of Consulting Engineers, American Metallurgical Society, American Society of Agricultural Engineers, American Society of Engineering Contractors, International Railway Fuel Association, Inventors' Guild, and the Mining and Metallurgical Society of America.

The Georgian Bay Canal and the Transportation Problem

By J. M. Shanly, M. Can. and Am. Soc. C.E.*

The Writer of This Article is Well Qualified to Express an Opinion as to the Advisability and Necessity of This Great Project of the Georgian Bay Canal, and His Clearly Drawn Comparisons and Detail of Costs Go to Show the Need There is for Caution Before Any Government of this Dominion Embarks on the Scheme.

WITH the opening and rapid development of our great grain producing areas in the Northwest, the question of cheap transportation to the seas becomes of greater importance every day, and naturally the project for a canal from the Great Lakes to the St. Lawrence, by way of the valleys of the Ottawa and French Rivers, is arousing interest among all classes of people. This route seems to have been especially designed by nature for such a waterway. The Indians in their canoes used it before the days of white men on this continent.; the early French explorers traveled it before they knew anything of the route, via the St. Lawrence, Lakes Ontario and Erie ; and, in the days before railways had become of great importance in the development of the Dominion, it was examined and reported on, for canalization, as an improvement over that then in use—via the St Lawrence and the lakes.

It is still a moot question whether the interests of Canada would be better served by the construction of a canal by this route, or by enlarging and improving the St. Lawrence and Welland Canals. Both propositions have their good points. It is not the object of this article to take up the discussion of the merits of these respective propositions, but rather to consider whether or not canals and artificial lines of navigation are the best possible solution of the transportation problem.

Railroad Development.

When the Georgian Bay Canal project was first discussed, canals were the chief means of communication between inland points, there were few railways in existence, and these were little better than short tramways with light iron rails, small cars and light locomotives. Operated by small, independent companies, freight rates were high and the service poor and uncertain. Under such conditions, canals were preferable in every way. In the half century or more since elapsed, railways have been steadily improving ; light iron rails have given place to steel, wooden cars of 15 or 20 thousand pounds capacity, have been replaced by steel cars capable of carrying 60, 80, or 100,000 pounds of paying freight ; locomotives have doubled and trebled in size and hauling capacity, and the old, more or less, disconnected tramways have become great trunk lines, stretching from ocean to ocean, and making such connections, that freight can now be loaded at almost any point on the continent and sent through to any other point without transhipment, and at rates undreamed of in the old days.

The end, however, has not yet been reached, for the great trunk lines are spending millions of dollars every year in cutting down grades, putting in extra tracks, and improving both road-bed and rolling stock, with the object of still further reducing the cost of transportation. New types of locomotives are being designed, each a little larger or better than the last, and people are even now discussing the possibility of increased economy by doing away entirely with the old familiar steam engine, and substituting for it the electric motor. A few years ago the canal was far ahead of the railway as an economical freight carrier, now they are probably on about an equal footing. What will be their relative positions in another decade ?

Georgian Bay Canal Report.

In response to popular demand, the Dominion Government has recently taken up the question of the Georgian Bay Canal, and a most thorough and complete survey has been made of the whole route. The report of their engineers is a model one, and covers the ground completely, leaving nothing, in connection with the scheme, to be guessed at or taken for granted. Detailed estimates of the cost of each section and accurate figures as to the ultimate capacity of the canal, based on the supply of water available at the summit, are given. From this report, we find that the cost of completing the canal will be, in round figures, $100,000,000. The annual cost of operation and maintenance, $900,000, and the estimated probable capacity, 15,000,000 tons per annum.

The capacity of three locks at Sault Ste Marie is given at 75,000,000 tons annually ; that of the Georgian Bay Canal may be therefore, put at one third of this, or 25,000,000 tons, as an absolute maximum. For many years to come the preponderance of the traffic will be eastward, and vessels coming down fully loaded would go back with half loads or less. On this basis, the paying traffic would be under 20,000,000 tons per annum.

Capacity Comparison With Railroads.

A double track railway line, with elevators and other terminal facilities complete and with maximum grades not exceeding 3-10 per cent., could be built and equipped from Montreal to the Georgian Bay, say 380 miles, for, at the outside, $30,000,000; or less than one-third of the cost of the canal. Over this line an ordinary consolidation locomotive could haul a net paying load of 2,300 tons, and, assuming as in the cost of the canal, that one-half the cars went back empty, an average load of about 1,700 tons. With one train each way per hour, the capacity of the line would be 24,500,000 tons per annum, or during the season of navigation, 16,500,000 tons. Trains could no doubt be run at shorter intervals than this, but no increase could be made in the number of vessels using the canal, so that the two systems would be about on an equality as regards capacity.

Freight Rates.

Owing to the fact that steamers bringing grain and iron ore down to Buffalo, can get return cargos of coal, etc., the freight rates are lower to that port than they would be by the canal route to Montreal. The rate from Fort William to Buffalo may be taken at about 50 cents per ton ; on the same basis, the rate to Montreal by the Georgian Bay Canal route would be about 80 cents, but the difficulty, at present, of securing full cargoes for the return trip, would necessitate this being increased to about $1.

The steamer rate from Fort William to a port on the Georgian Bay, including transhipment at the latter point, might be figured at about 55 cents per ton ; this deducted from the canal rates leaves 45 cents per ton for the charge on our proposed railway end of the business. We will take as a basis, the returns of the Canada Atlantic, which runs through the same section as our proposed line. In 1909, the cost of hauling a freight train one mile on this road, was practically $1.25. At this rate, the cost of taking a train, carrying an average load of 1,700 tons, over our 380 miles of line, would be $475, or 28 cents per ton, leaving a margin of 17 cents per ton for bond interest, etc. Whether the earnings would be sufficient to cover all fixed charges, would of course, depend largely on the volume of the traffic ; but.

* Civil Engineer, Montreal.

putting the rate of interest on bonds at 5 per cent., the total annual fixed charge would be $1,500,000, and a traffic of 9,000,000 tons would provide that amount.

Allowing 4½ per cent. interest on the cost of the canal, and $900,000 a year for maintenance and operation, its total annual charges would be $5,400,000, to meet which a greater freight charge, than the $1 per ton above mentioned, would have to be made, or an additional tax put upon the country at large.

Coal from the lower provinces and traffic of that class could no doubt be taken through more cheaply by canal than by rail and water, owing to the saving of cost in handling and diminished deterioration losses, but, so far as the traffic in grain and food stuffs is concerned, the railway would have the advantage. The canal would, in government hands, act as a regulator of freight rates ; but so would a government owned railway. Both propositions would open up new sections of the country, and tend to encourage local industries. The construction of the canal would develop enormous water powers ; but these can be developed as well, and at much less cost, without the canal. As things stand at present, it is a fairly even race between rail and artificial navigation.

The Canal Value Still Uncertain.

What the future may have in store can be only guessed at ; but, while the canal is limited in its capacity by the available water supply at the summit, the railway is capable of practically unlimited expansion by the construction of extra tracks and improved terminals. The canal, as designed, is capable of accommodating much larger vessels than the average freighters now in use on the lakes ; the railway could also use more powerful engines than those figured on here, and thus largely increase the size of its trains. As an example, there may be cited the "Mallet" Compound Locomotives, recently built at the Angus Shops of the C.P.R. These engines can haul one hundred cars each loaded with 30 tons, over the 3-10 grades of our supposed railway, increasing the assumed train load nearly one-third, on very slightly increased cost.

In conclusion, the writer does not wish to be classed as an enemy of canals, which have in the past been of immense value to the country, and which will no doubt, continue to be so for a long time to come ; but the development of railways has now reached such a stage, that apparently the old time pre-eminence of the canal has disappeared, and therefore, he is of the opinion that such an enormous undertaking as the construction of the Georgian Bay Canal should not be commenced until all alternative schemes have been carefully studied.

FINANCES OF CANADA.

A statement of the public accounts for the last fiscal year shows receipts of $117,780,409.78, and expenditures of $87,774,198.32, leaving an apparent surplus of $30,006,211.46 on consolidated account. An additional outlay of $30,852,563.38 is shown on capital account, including $23,487,986.19 spent on the transcontinental railway, $1,597,663.48 on bounties, including iron and steel, $1,138,748; lead, $248,534; binder twine, $49,784, and petroleum, $160,596. The debt increased $3,773,505. The Ottawa mint made a profit of $861,188 on its coinage of silver, and $34,827 on copper coinage. A further profit of $15,889 comes from the excess bank circulation during the harvest.

WORKERS TOO OLD AT FORTY.

That a man cannot get a new position after he is forty years old was asserted before the Employers' Liability and Workmen's Compensation Commission at Washington, by Arthur E. Holder of the American Federation of Labor. He had been speaking of the satisfactory operation of the British compensation act of 1906, which recently he had investigated, when a question was asked as to its effect on the employment of men of advanced age.

In reply, Mr. Holder said that regardless of this law there was a marked discrimination against the aged—not only in Great Britain, but throughout the industrial world. The man who is over forty and who has a few grey hairs, cannot get back when he once loses his job, but he can hold on if he has a place," he said. "It is the same here as it is in England, and it is the same in Germany and throughout the continent." This condition was not due, said Mr. Holder, to any legislation, but was the result of economic conditions and came from the determination to get the greatest amount of product out of the human being employed.

With reference to the extent of compensation for death or injuries, Mr. Holder said he thought the law should grant "all that the traffic will bear." He declared no death benefits should be less than $5,000, and no injury award less than a dollar a day, regardless of the ordinary compensation of the injured employee.

STEEL TUBING.

The Customs Department recently issued an order respecting certain classes of steel tubing. It provides that the dumping duty of 1907 shall apply, without any exemption allowance, to iron and steel tubing of from four to eight inches diameter of a class made in Canada. This is a tightening up of the dumping law as a slight measure of protection for Canadian industries. The same order places smaller sizes of tubing on the same basis as rolled rail and steel as regards the dumping law. The tax to be imposed where the difference between the fair market value and the cost to the Canadian importer does not exceed five per cent.

EFFECT OF TUNGSTEN IN TOOL STEEL.

While tungsten has been known for many years, its economic importance is of recent growth. The meaning of the name is heavy stone and its most important use, according to Frank L. Hess, of the United States geological survey, is an alloy for tool steel. Lathes equipped with tools made from tungsten steel may be speeded up until the chips leaving the tool are so hot that they turn blue, an operation that would spoil the temper of high carbon steel. It is stated that about five times as much work can be done with lathes built for such speed and work, as can be done by the same lathes with carbon steel tools. From 16 to 20 per cent. of tungsten is ordinarily used in lathe tools. The melting point of tungsten is 5,576 degrees Fahr. Tungsten also has important use in making filaments for incandescent lamps, crucibles for electric furnaces and various other articles.

OFFER OF PRIZE.

The Society of German Foundry Engineers, with headquarters at 60 Sybelstrasse, Charlottenburg, Germany, announces that it will offer prizes of 1,000, 500, and 300 marks ($238, $119 and $71.40) to the writers who will submit the best three treatises on the following question: "Have real advances been made in the construction and operation of cupolas during the last 20 years?" Full details regarding the contest may be secured by addressing the society.

Investigations have been made at the German official testing bureau for materials to ascertain to what extent repeated meltings of bearing metals influence their strength and reliability. As regards white metal (alloys of copper, antimony and tin) it was found that repeated meltings did not noticeably alter the grain, but that the rate of cooling had a considerable influence. Quick cooling yielded a finer grain and higher hardness and strength, and the investigators recommend that white metals should not be heated to high temperatures and that they should be cooled rapidly. Bronze, poor in tin, and, therefore, comparatively inexpensive, may have its hardness and strength increased by being rapidly cooled from a temperature of 1440 degrees F.

SYSTEMATIC BUSINESS MANAGEMENT

Practical Articles for Managers, Superintendents, and Foremen, to Assist in Carrying on the Business Economically and Efficiently.

AN AWARDS SCHEME.

THE William Denny Bros., Leven Shipyard, Dumbarton, Scotland, "Awards Scheme" was one of the first of its kind to be established, and has now been in existence for twenty-nine years. It has encouraged the men to take a greater interest in their work, and to study means by which output may be improved. The scheme makes provision for awards to workers, exclusive of head foremen or heads of departments, as follows:—

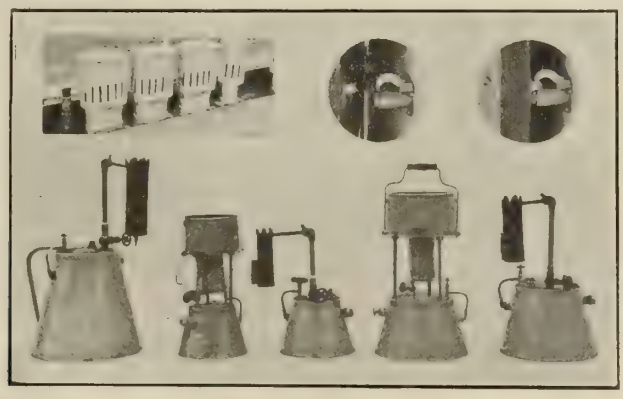
1. Inventing or introducing a new machine or hand tool.
2. Improving any existing machine or hand tool.
3. Applying any existing machine or hand tool to a new class of work.
4. Discovering or introducing any new method of carrying on or arranging work.
5. Generally, making any change by which work is rendered either superior in quality or more economical in cost.

The adjudication of the awards is in the hands of a nominee of the yard and of the engine works respectively, in collaboration with an impartial president from outside the firm. The committee make a money award, within certain limits, according to their estimate of the value of the invention, and if a workman succeeds in gaining five awards (which has been the case not infrequently) he is granted a sum of money equal to the amount of awards he as gained, and so on for every five awards. If an idea be sufficiently important to patent, the firm (in the event of the workman being unable to do so himself) look after his interests, in addition to giving him a special award.

During the time the scheme has been in existence a sum of about $12,500 has been granted in awards and premiums, and quite a number of highly serviceable inventions might be cited as being in practical use.

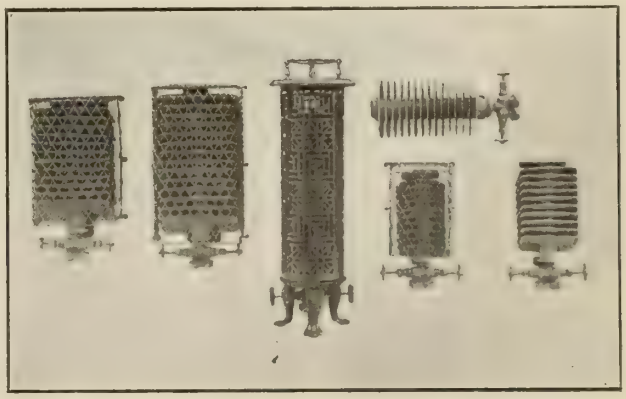
The Denny-Brace spark catcher has been largely adopted by shipowners, and is recognized as adding considerably to the comfort of those traveling on board ship.

A popular form of compact heating apparatus is the D.S.S. radiator, which is not only well adapted to ships compartments, but to railway carriages or other place where space is a consideration.



A simple, but very serviceable little invention is the Denny & Thompson combination door hook and buffer, by which an open door can be instantly and automatically secured, and easily released when required to be shut.

The Denny-Porterfield patent sidelights have been adopted by several leading steamship companies, and are found most efficient. They have the advantage of giving the largest possible lighting area for any given frame space, and, while water is efficiently excluded, the ventilating arrangements are complete and compact.



The Fyfe improved upcast ventilator has been on the market for many years, and is still largely in demand.

A highly important invention has lately been perfected by Archibald Denny and Charles Henry Johnson of the shipyard electrical staff, and is known as the Denny & Johnson torsion meter. By means of it, the torsion of revolving shafts may be ascertained, thus enabling the power transmitted to be calculated.

The accompanying cuts show in some detail a limited number of devices resulting from the operation of the foregoing awards scheme.

Wm. Denny Bros.' awards scheme—Fyfe ventilators. Denny-Thomson door hook.

Wm. Denny Bros.' awards scheme—D. S. S. radiators. Denny-Gourlay Lamps.

SCIENTIFIC MANAGEMENT.

THE U. S. War Department has given considerable attention to the utilization of methods of scientific management in the various arsenal shops of the government. The arsenal at Watertown has been used practically as an experiment station with a view of trying out the theory before applying it generally. There, a "planning" room was established which relieved the foreman of much clerical duty and insured a continuous flow of work without cessation and loss of time. Men were assigned to keep the tools of others sharpened, and laborers or messengers attended upon the higher priced machinists, who were thereby enable to devote their whole attention to production. Another set of men kept the plant in thorough order, so that it could be worked at its highest efficiency. Experts were employed to show the workmen just how fast their machines should run and how deep their tools should cut.

As a result, it is stated that it was possible to reduce materially the cost of manufacture. For example, the labor cost of one set of parts for a 12-in motor carriage was cut from $480 to $275, and corresponding reductions were made in other directions. A report on this experiment at the Watertown Arsenal has recently been made public, and in commenting on it, Secretary of War Stimson states that the results thus far are highly gratifying and full of promise. There has been an undoubted increase in

the efficiency of the workmen at the shop, and a material reduction in the cost of manufacture. At the same time, and to my mind, a matter of even greater importance, is the fact that these results have been obtained without in any wise endangering the interests of the workingmen, either by decreasing their pay or requiring unpleasant exertion or "speeding up." On the contrary, any increase in real efficiency must bring about larger benefit to the operatives.

PLANING MILL ELECTRIFICATION.

The latest addition to the list of electrically operated wood-working plants in the Canadian West is the mill and box factory of the Brunette Sawmill Co., Sapperton, B.C. The generating equipment is housed in a reinforced concrete building 25 ft. x 35 ft., equipped with metal sheathed doors, steel windows with wire-glass panes, and otherwise of fireproof construction.

The main generating unit is a 500 kv.a., 3-phase, 60 cycle, 480 volt, 3,600 r.p.m., A-C-B. steam turbo-generator, designed for operating condensing on 110 lbs. steam pressure. The turbine has a rated output of 670 h.p., and has twenty-five per cent. overload capacity. The exciter used in normal operation is a 15 kw. C. G. E. turbo-generator running at 4,500 r.p.m. A second small unit of 35 kw. capacity, A-C-B manufacture, direct-connected to a 9 x 10 Ideal engine, is normally used for the lighting of the mill and the operation of several small motors, but is also counted on as a reserve exciter in case of mishap to the smaller one.

The switchboard apparatus is of the pedestal type, installed by the Canadian Westinghouse Co. A Tirrill automatic voltage regulator is used. Four main circuits are laid from the power house, two to the planing mill, one to the box factory, and one to the saw-mill; the local distribution in each case being from a steel cabinet containing a slate panel upon which all the starting fuses for the various motors are mounted. The wiring is in steel conduit throughout, with approved condulet fittings. The motors for the most part are directly connected by flexible couplings to the machines they drive.

Mather, Yuill & Co., Vancouver, designed and supervised the installation.

HIGHEST TRANSMISSION VOLTAGE IN THE WORLD.

Transformers for a 150,000 volt transmission line are now under construction by the Allis-Chalmers Co., Milwaukee, Wis. They are 4,000 kv.a. single phase, 60 cycle, oil filled and water cooled, for service on the Pacific coast on the lines of the Nevada-California Power Co. These transformers are designed for 36,000 and 6,600 volts on the low side, and 87,000 volts on the high voltage side. Three form a group which will be connected in "delta" on the low voltage side. The high voltage side is connected in "Y" to give 150,000 line voltage. The transformers are designed for an insulation test, between high voltage and low voltage coils, or between high voltage coils and iron, or 300,000 volts, alternating current, for one minute. The principal dimensions are as follows :— diameter of base 8 ft. 10 in.; height to top of cover 15 ft. 8 in.; height to top of high tension terminals 19 ft. 10 in. With normal supply of cooling water these transformers will carry full rated load for 24 hours with a temperature rise not exceeding 40 degs. C. They will carry 25 per cent. overload continuously with a temperature rise not exceeding 55 degs. C. Each transformer complete with oil, will weigh about 43 tons, and the efficiency at full load will, it is claimed, be considerably over 98 per cent.

NEW AND OLD LOCOMOTIVES.

The Pacific type locomotive, which the Pennsylvania Railroad has adopted for heavy passenger service, is the largest and most powerful passenger locomotive in use on that road. The locomotive and tender of this Pacific, or K-2 type, when loaded with coal and water, weigh about 430,000 pounds. There are six driving wheels 80 inches diameter, and the boiler contains 359 tubes, each 20.9 feet long by 2¼ inches diameter, making a total of nearly 1½ miles of tubes. The heating surface of the tubes is about 4,420 square feet, and, in addition, the fire-box has a heating surface of 199.3 square feet, the steam pressure is 205 pounds.

The oldest American locomotive, the "John Bull," put into service on the Camden and Amboy Railroad in 1831, now in the National Museum, at Washington, weighs 24,625 pounds. It has 54-inch driving wheels, and 7 foot 6 in. tubes, giving a heating surface of 213 square feet.

PROFIT SHARING AT A PAPER MILL.

The following intimation, affecting about 700 employees, has been posted in the various departments of the Inveresk Paper Mills, Musselburgh, Scotland :— "As recognition of the exertions of their employes during the past year, the directors have decided to give a bonus at the rate of one week's pay, which will be paid during the first week of December. With the view to continuing this system in the future, the directors venture to ask for the hearty co-operation of all their employes, who can by carefulness and diligence, render it possible and perhaps extend it." The managing director of the company, R. C. Menzies, J.P., St. Michael's, Inveresk, and the other proprietors, have shown a keen interest in the welfare of the workpeople by surporting their bowling green, their reading and recreation rooms, and in other ways.

THE GEORGIAN BAY CANAL.

A recent visitor to Ottawa was Sir Robert Perks, of the contracting firm of MacArthur, Perks & Co. In the course of an interview, Sir Roberts Perks stated that he entertained hopes for the early construction of the Georgian Bay canal. The repudiation of reciprocity would expedite the carrying out of the project. The Panama canal, he said, would be completed in 1913, and the United States would make a desperate effort to divert Canadian trade to Canada's western ports, to the detriment of the East. With the completion of the Georgian Bay canal, Ottawa would become a port in much the same way as Manchester became a port through the building of the Manchester ship canal. The construction of a canal from the St. Lawrence to Ottawa would take five years.

ST. LAWRENCE RIVER COMMISSION.

The commission which will deal with navigable conditions on the St. Lawrence River is composed of :—Professor C. H. McLeod, McGill University; W. I. Gear and Arthur Surveyor, Montreal. The appointment was made by an order-in-council dated August 29th, and will be known as the St. Lawrence River Commission. The duties of the new organization will be to examine conditions prevailing in the river and to report upon the many power schemes now before the federal authorities and the effect of such works upon the navigation of the river. Its jurisdiction will extend from the head of Lake St. Francis to the port of Montreal. The commission will also study the improvement of the river channel and the feasibility of deepening the water highway to the sea to a depth of 22 or 25 feet

"Work of the right kind strengthens the body, and develops the mind and the character. Remember what you do today helps on what you do to-morrow. Your daily efforts are linked together and cannot be considered alone."

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

Toronto, Ont.—The Semet-Solway Co., of Syracuse, N.Y., propose establishing a big coke manufacturing plant here. The proposed plant will cost about $2,500,000. Coal by-products will also be manufactured.

Saskatoon, Sask.—The W. H. Church Co. will establish a plant here to manufacture a patented cement land packer. They will also carry on a general machine and foundry business.

Sarnia, Ont.—The Robeson Preserve Products Co. have decided to locate at Point Edward, where they will engage in the manufacture of a preservative of wood, canvas, iron, steel, concrete, etc.

Hamilton, Ont.—It has been announced that next year the Steel Company of Canada will spend $2,000,000 enlarging its plant. The plans include a rod, blooming and billet mills, and two sixty-ton continuous open-hearth furnaces.

Sarnia, Ont.—The Mueller Manufacturing Co. contemplate establishing a brass factory here. The town is being asked to grant a bonus of $20,000.

Calgary, Alta.—Hon. W. H. Cushing may engage in the manufacture of street cars here.

Wingham, Ont.—The ratepayers passed the by-law to grant a loan to the Western Foundry Co. to construct a new building and instal a new plant.

Port Colborne, Ont.—A smelting works is ready to locate here providing a lease of dockage can be secured.

Vancouver, B.C.—The Granby Consolidated Mining & Smelting Co. intend erecting a reduction works at Goose Bay, Observatory Inlet, Portland Canal District. $1,000,000 will be expended.

Hedley, B.C.—The machine shops of the mining plant of the Hedley Gold Mining Co. have been improved by the addition of an arrangement for grinding worn-out locomotive drive wheels and car trucks. Another addition recently made was the installation of a powerful magnet to separate the mine steel from the ore.

Welland, Ont.—It is expected that the John Deere Manufacturing Co. will shortly commence the erection of their $1,000,000 plant here.

Oakville, Ont.—The Ware Mfg. Co. are building a factory here, 61x180 ft. and one-storey high.

Moncton, N.B.—A recent announcement from semi-official sources, says that a portion of the I.C.R. workshops here will be transferred to Riviere du Loup, Que.

Pembroke, Ont.—Fire did $50,000 damage to the works of the Thomas Pink Co. recently. The machine shop and a quantity of valuable tools and patterns were completely destroyed.

St. Johns, Que.—The ratepayers have voted to bonus the Lightning Furnace Co., of Montreal, and the latter are now preparing to establish themselves here.

Kingston, Ont.—Geo. Wright's machine shop was entered recenty by burglars who made away with tools to the value of $35.

Ladysmith, B.C.—The Tyee Copper Co. will instal converters in their smelting plant here and otherwise improve their property.

Wingham, Ont.—A farm implement manufacturing firm has been in touch with the authorities and will likely establish an industry here.

Galt, Ont.—The Katie Foundry Co. are among the first to take advantage of the industrial sites in Galt, They will establish an up-to-date plant here, work on which will be started next spring.

Regina, Sask.—Fire wiped out the plant of the American Abell Thresher and Engine Co. here recently. The estimated damage is distributed as follows: buildings, $10,000; separators and engines, $60,000; and repairs, $100,000.

North Battleford, Sask.—A newly incorporated company, Wm. Clark & Co., have secured a site and will erect a foundry and shops 40 x 80 feet.

Galt, Ont.—Work on the Canadian Motors, Limited new building is considerably advanced. Other buildings will be erected in the spring.

Welland, Ont.—The new buildings for the Page-Hersey Co. have been completed and manufacturing will be started just as soon as the new machinery is installed.

Guelph, Ont.—The Stewart Sheaf Loader Co., of Winnipeg, will establish a $100,000 factory here, and give employment to 400 men. It is expected that the new factory will be completed by the first of November, 1912.

Fort William, Ont.—Frank V. Samwell, of Guelph, will establish a foundry here for the manufacture of wrought iron pipes. The plant and equipment will cost about $200,000, of which the city is being asked to loan $100,000. 500 men will be employed.

Trenton, Ont.—The new C.N.R. shops are practically completed. The works include fifteen stalls, boiler shop and machine shops, and occupies five acres of land.

Lindsay, Ont.—Several improvements are being made to Horn Bros.' woollen mills. The boiler shop has been enlarged by the addition of a brick building 48x118. A 150 h.p. boiler and a 100 h.p. Corliss engine are also being installed.

Point Levis, Que.—The G.T.R. round house was wiped out by fire recently.

Quebec, Que.—The C.N.R. have agreed with the city to immediately commence the erection of their workshops here. In addition to the car shops, a round house and storehouse will be built.

Special Machinery and Models Made to Order.

Milton, Ont.—The Imperial Foundry Co. shipped its first hot water boiler recently, the same going to a Toronto tenement house.

Regina, Sask.—The sum of $4,418 will be applied to the purchase of equipment for the municipal railway's machine and blacksmith shop, armature shop, pit and motors.

Porcupine, Ont.—A second-hand stamp mill has been acquired by the Little Pet Mine from the Swastika Mining Co. A new stamp outfit will likely be put in.

Windsor, Ont.—The ratepayers cast their votes in favor of the by-laws granting inducements to the Hupp Motor Co. and the White Machine Works. The latter concern are erecting a steel plant 100 x 36 ft., while the former have prepared plans for two buildings 176x 128 ft. and 175 x 36 ft.

Saskatoon, Sask.—Messrs. Straphy & Spencer, of Medicine Hat, have been here with a view to locating an industry for the manufacture of a patent pump which they are introducing.

MUNICIPAL.

Saskatoon, Sask.—The municipality is planning to spend $72,000 for storm sewers.

Point Claire, Que.—The municipality is taking steps to install drains, waterworks and electric light.

Blairmore, Alta.—The ratepayers will be asked to vote $45,000 for a waterworks system.

Medicine Hat, Alta.—The municipality is planning to spend $45,000 extending the waterworks.

St. Catharines, Ont.—The ratepayers will vote on a by-law to offer $38,000 to the St. Catharines Artificial Gas Co. for their works, plant and business.

Vancouver, B.C.—The city engineer has estimated that $7,000,000 will be required to finish the city's work, which includes sewers, street improvements and board of works plant.

Penetanguishene, Ont.—The ratepayers will be asked to pass a by-law to place the waterworks and electric light under the management of a commission.

Moose Jaw, Sask.—The ratepayers passed three debenture by-laws totaling $603,000 for waterworks, fire apparatus and sidewalks.

Brandon, Man.—The ratepayers have decided to grant the street railway franchise to a private company, instead of inaugurating civic ownership.

Montreal, Que.—The city is planning to spend $500,000 to continue the water filtration scheme.

Medicine Hat, Alta.—The ratepayers will vote on a by-law to provide $45,000 for water main extensions.

Three Rivers, Que.—The ratepayers gave their assent to a by-law providing for an electric street car system.

Ingersoll, Ont.—The burgesses passed the by-law providing $7,500 for industrial purposes.

Neepawa, Man.—The by-law to raise $100,000 for a waterworks system was carried.

ELECTRICAL.

Berlin, Ont.—The by-law to provide $25,000 for lighting purposes was carried by the ratepayers.

Swift Current, Sask.—The by-law providing for an electric light system was passed by the ratepayers.

Baden, Ont.—The ratepayers have authorized an expenditure of $5,000 for the erection of a power plant.

Beachville, Ont.—The by-law to raise $5,000 for a Hydro-Electric power plant was carried by the burgesses.

Rouleau, Sask.—The ratepayers passed the by-law to raise $15,000 for the completion of the electric light system.

Sturgeon Falls, Ont.—The town will purchase the Sturgeon Falls Electric Light & Power Co. for the sum of $25,000.

Waterford, Ont.—The by-law providing for an electric power service was passed by the ratepayers.

Killarney, Man.—An offer subject to the approval of the ratepayers has been made for the purchase of the Collison Electric Light Co. for $13,000.

Upton, Que.—The municipality is planning to instal a waterworks and electric light plant.

Brantford, Ont.—Several conferences were held here recently with regard to Hydro-Electric power, and by-laws providing for same will likely be submitted here and in Paris, in the near future.

Toronto, Ont.—The proposed Hydro-Electric extension by-law will entail an expenditure of approximately $2,220,000.

Lethbridge, Alta.—The report of the superintendent of engineers to the city council in brief, is as follows: In the power house they have generated 138,055 kilowatt hours in July, 109,185 kilowatt hours in August, and 128,080

kilowatt hours in September, making a total of 375,420 kilowatt hours for the quarter. Water pumped was as follows; July, 34,204,000 gallons; August, 27,911,000 gallons; September, 280,233,000 gallons, making a total of 90,138,000 gallons for the quarter. The finances are as follows:

	Receipts.	Expenditures
July	$6,111.12	$4,009.07
August	7,436.52	4,034.78
September	7,489.82	4,433.06
	$21,037.46	$12,476.91

This shows a profit of $8,560.55 for the quarter. Deducting $6,109.92 quarterly interest and sinking fund, there is left a net gain of $2,450.63. Adding that of the previous six months, $8,414.77, there appears a total profit of $10,865.40 for the nine months.

Quebec, P.Q.—It is reported that the Quebec Government is likely to follow the Ontario Government and appoint a commission with similar powers to the Hydro-Electric Commission, in the near future. It is also stated that the head of the new commission will be Hon. S. N. Parent, late chairman of the Transcontinental Railway Commission.

Halifax, N.S.—Report states that the Dartmouth Electric Light Co. will pass into the possession, about the new year, of F. B. McCurdy & Co., for parties who did not appear in the transaction. It is further reported that the property is being purchased for the Nova Scotia Power Co., whose plant will be on the Mersey River, eighty miles from Halifax. The present owners of the Dartmouth plant are the Royal Securities Co.

Niagara Falls, Ont.—The Court of Revision has refused to entertain the appeal of the Ontario Power Co. for a reduction of assessment from $1,941,000.

Ottawa, Ont.—An order-in-council has been passed formally approving the plans of the Cedar Rapids Power Co., for the development of power at Cedar Rapids in the St. Lawrence River.

Ottawa, Ont.—It is the intention of the Ottawa Electric to largely add to their steam auxiliaries in the near future as well as to proceed with further larger waterpower development to the extent of ten thousand horsepower at the Chaudiere. The company owns the waterpower in the middle of the Deschenes Rapids between the Hull Electric and Metropolitan powers, with a view to future development. The business is increasing and the contemplated improvements are to keep pace with it.

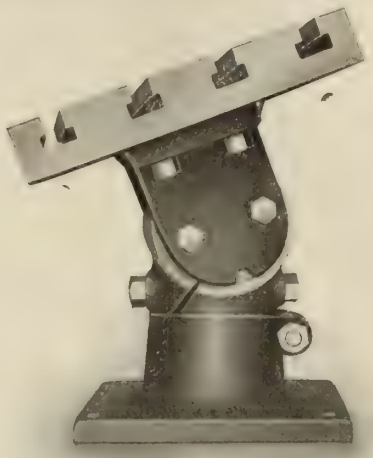
St. John, N.B.—Cheaper power for new industries in St. John will be secured if the provincial legislature ratifies the agreement made between the city council and the New Brunswick Hydro-Electric Co. The latter has been given a fifty years' franchise, subject to various provisions, and the maximum rates for power and light are stated as part of the agreement. The company proposes to generate power at Lepreaux and transmit it to the city. Its franchise is not exclusive and will not prevent the Inglewood Pulp and Paper Co., which has valuable waterpower nearer to the city, from doing business on similar terms. The latter company has also opened negotiations with the city. The outlook, therefore, is for cheap light and power.

Winnipeg, Man.—The civic power commission of Winnipeg, has closed a long term contract with the Canadian Pacific Railway for the supply of 500 horsepower from the Point du Bois plant.

Byron, Ont.—The residents have asked for hydro power, and Superintendent Glaubitz, London, has promised to take up the extension of the line for them at once.

Virden, Man.—The mayor and council are open to receive proposition for installation and operation of light and power plant within the town limits. Information from Secy.-Treas. J. F. G. Menlove.

Waterford, Ont.—The by-law to install an electric lighting system carried by a vote of 176 to 46, and tenders will be called at once.



Saskatoon, Sask.—The new power house being erected at Saskatoon is well under way. The steel work and most of the brick work is completed. The floor space covers an area of 85x54 feet. Three 500 h.p. boilers are being installed this autumn, which will operate three generators not yet set in place. The boilers are of the Babcock & Wilcox type. It is expected that a large hydro-electric plant will be started next spring, a few miles out of Saskatoon, by a private company. It is also expected that the same company will construct and operate a street railway system. The present intention is to obtain power for the city's requirements from the hydro-electric installation when complete. To this end the power house is being made large enough to accommodate transforming equipment.

Windsor Mills, P.Q.—The Corporation of Windsor Mills, P.Q., has accepted the tender of the Canadian Crocker-Wheeler Company, of St. Catharines, Ont., for three-phase sixty-cycle apparatus, to replace the present equipment of 125-cycle single-phase.

BUILDING NOTES.

Montreal, Que.—A new apartment house is to be erected on Bishop Street. It will cost $100,000.

Medicine Hat, Alta.—Messrs. H. E. Lotz and K. J. McRae are planning to build a new opera house here.

Toronto, Ont.—The Masons of Toronto are preparing to erect a $250,000 hall here.

Vancouver, B.C.—Representatives of the Sullivan and Considine circuit have been here in connection with the proposed new theatre.

Calgary, Alta.—The city engineer has prepared plans for a new traffic and street railway bridge, to cost $100,000.

Brandon, Man.—The Manitoba Winter Fair board have prepared plans for a building to cost $80,000.

Toronto, Ont.—Entirely new plans have been prepared for the new Central Y.M.C.A. The new plans call for a building to cost $500,000.

SAW AND PLANING MILLS.

Calgary, Alta.—The Wattsburg Lumber Co., of Wattsburg, B.C., contemplate establishing a sash and door factory here.

Calgary, Alta.—The Riverside Lumber Co. intends erecting a box factory here in addition to their already large plant.

Quesnel, B.C.—The Reid sawmill was totally destroyed by fire recently, the loss being in the neighborhood of $15,000.

Emo, Ont.—W. J. Thompson, of Kenora, has reconstructed and improved the old Matchet sawmill here.

Edmonton, Alta.—The Edmonton Casket & Box Mfg. Co. intend erecting a new and greatly enlarged plant.

Beamsville, Ont.—The planing and flour mills of R. O. Konkle were destroyed by fire recently. The loss is $9,000.

Prince Rupert, B.C.—Anthony Ludgate, of Pembroke, Ont., proposes building a lumber mill and will probably locate it near Kitsumkalum.

Fruitvale, B.C.—Darseveld Bros. are preparing to erect a sawmill here.

Dryden, Ont.—The Dryden Timber & Power Co. have commenced the erection of their pulp and paper mill. It is expected that it will be completed by next July.

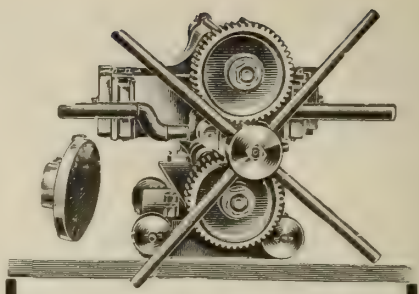
Mull, Ont.—The lumber and stave mill of Neil Watson was destroyed by fire recently. The damage amounted to $8,000.

Kamloops, B.C.—The Kamloops Sash and Door Factory will be greatly enlarged. The new premises will be equipped with modern machinery.

GENERAL MANUFACTURING

Toronto, Ont.—Plans are being prepared for erection of a tanning factory to cost $13,000 for W. B. Levack, 1189 Bathurst Street, Toronto; 2 storeys, brick and concrete, concrete foundation, tar and gravel roof, steam heating, electric lighting, fire escapes, tanning machinery, brick, concrete vats, etc.; sprinkler system, pumps, engines, boilers, and beam house equipment.

Hamilton, Ont.—Tenders will be called shortly for extension to plant to cost $2,000,000, on Sherman Avenue, of Steel Company of Canada. Morgan & Co., Worcester, Mass., U. S., are preparing plans. Rod mill, blooming mill, billet mill, two 60-ton continuous open-hearth furnaces are required.



Edmonton, Alta.—Tenders are called until Jan. 1 for machinery for Edmonton Portland Cement Co., Hoser, Ryder block, Edmonton; coal crushers and pulverizers; also clinker crushers.

Aylmer, Ont.—The Aylmer Pump & Scale Works will enlarge its offices and make extensive improvements in them. Modern equipment will be required.

Brantford, Ont.—The Cockshutt Plow Co. is said to have acquired a controlling interest in the Brantford Carriage Works and the Adams Wagon Works Co. Both plants will extend.

Brantford, Ont.—It is expected that the Barber-Ellis Co. will build a factory on Marlboro Street, to employ 250 hands.

Calgary, Alta.—W. H. Cushing, sash and door manufacturer, Calgary, is contemplating the erection of a plant for the manufacture of street car bodies. The Western Machine & Supply Co. have made application to the city for a site in the Manchester subdivision for erection of a factory. The company wishes to engage in the manufacture of iron products. Industrial Commissioner Mr. Miller, Craig and Rose, Edinburgh, Scotland, are contemplating the erection in the city of a plant to manufacture paints and varnishes. Fraser & Seablow are excavating for business block, cost $30,000, in East Calgary; architect, L. Dowler. Alexander block, Calgary; four-storey, 33x80, brick, concrete foundation, steam heating (steam boiler), electric light, tar and gravel roof, hardwood interior finish. Remainder of work in spring. No general contract let. It is probable owner will supervise.

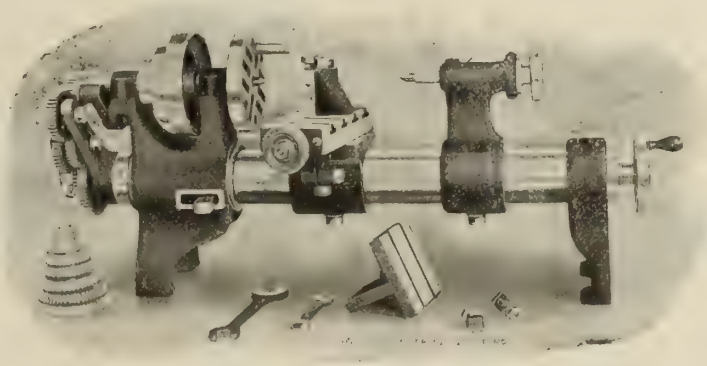
Ker & Goodwin
Brantford, Canada

THE MANAGER OF

THE LARGEST WORKS IN CANADA



must at times feel the need of an inexpensive lathe for his private experimental work. Much good thought and invention die out for want of easily and cheaply making experiments or models of an idea, a whole workshop of expensive tools usually being required, although the model needed may be small.

WE HAVE DESIGNED A TOOL FOR THIS WORK

A complete, self-acting, sliding, boring and screw-cutting lathe, 4 in. centres, 2 ft. 4 in. bed, capable of doing all plain milling, keyway cutting, etc.

ITS COST IS $24 AT WORKS IN ENGLAND

There is no suggestion of toy about it; it is a tool rigid enough for the heaviest work it can hold.

GENERAL BUILDING.

Port Arthur, Ont.—The Pella Stocker Co., of Pella, Ia., will locate the Canadian branch of their industry here. The buildings and site will cost $45,000.

Kingston, Ont.—The G. T. R. have applied for 750 h.p. to run a drilling and crushing plant at a granite quarry to be located a few miles from here.

Portage la Prairie, Man.—The new addition to the Stephens Brick Co. was completed recently. It is operated by a 50 h.p. steam plant.

Chatham, N.B.—Groat's carriage and repair shops suffered $4,000 loss by fire recently.

Woodstock, Ont.—The City Dairy Co., of Toronto, are erecting a $12,000 building here and will make Woodstock their distributing point. They will also manufacture butter and condensed milk.

Brantford, Ont.—The carriage shop of Reeve Cameron was destroyed by fire recently. The loss is $1,500.

Port Cilborne, Ont.—The Crown Gypsum Co., Lythmore, in Oneida Township, have let the contract for a new factory, 244x70 feet. Modern machinery will be installed.

Calgary, Alta.—Mayor H. A. Shortt and Conrad Knapp, of the Michigan "Soo," contemplate spending $100,000 in the erection of a brewery here.

Toronto, Ont.—Scythes & Co. have purchased the two-storey factory at 243 Macdonell Ave. for $13,000. The property is 50x225 feet.

Ottawa, Ont.—The Wm. Davies Co., of Toronto, will erect a large warehouse here. This will include a cold storage plant.

Toronto, Ont.—The Cooper Cap Co. are erecting a $60,000 warehouse at the corner of Grange and Spadina.

Sydney, C.B.—Nash & McAllister are erecting a bottling plant in connection with their soda water factory here.

Toronto, Ont.—The Copland Brewing Co. are building a $50,000 addition to their brewery here.

Wallaceburg, Ont.—The Dominion Sugar Co. have placed an order for two new 700 and 800 h.p. gas engines, which will be about the biggest in Canada.

Bracebridge, Ont.—The Shier Lumber Co. contemplate building a chemical plant here.

Massett, B.C.—It has been reported that an English company has purchased the oil plant at Skidmore and will expend $50,000 on a cold storage plant.

St. John, N.B.—T. S. Simms & Co. have secured a site for their new brush factory here.

Hamilton, Ont.—The Dominion Canners have set aside $500,000 for extending their plants at various centres. $100,000 will be spent on a factory here.

TRADE NOTES.

The Canadian Tap & Die Co., Galt, Ont., are soon to add to their now extensive line of Little Giant screw plates by placing on the market a new set, which, while maintaining their high degree of accuracy, will be sold at a price that will bring it within the reach of everyone. Its capacity will be ¼ to ½-in. by 1-16th.

The Russell Machine Co., St. Catharines, took a contract recently to cut a 40-inch gear, and successfully completed the work on a McGregor-Gourlay shaper. This is something new in the cutting of gears. Special jigs were made for the purpose. Some large concerns in the machine repair business turned this work away. Great credit is due this young, enterprising firm. They recently made alterations at their factory and equipped themselves for all kinds of drop forging and press work, having installed the latest machinery necessary for this purpose.

The St. Catharines Brass Works is a rapidly growing concern, having recently made an addition to their plant.

NEW TORONTO, ONT., CANADA

The Kerr Turbine Co., Wellsville, N.Y., advises that over 700 of their machines, aggregating more than 50,000 h.p., are in active service, and that more unfilled orders are now booked than at any previous time in the history of the company. Although their plant has been materially enlarged, a night shift has been necessary for the past two and a half years. Among recent orders are the following: One 350 kw. turbo-alternator for the Brooklyn refinery of the Standard Oil Co.; two 2800-gal. per min. turbo-pump units for Tidewater Oil Co.; two 75 kw. and one 35 kw. lighting sets to American Shipbuilding Co., for the new steamer "City of Detroit"; two 75 kw. lighting sets for waterworks service, City of Chicago; one 60 b.h.p. turbo-generator, with prony brake attachment, for the University of Melbourne, Australia (this unit takes steam at 200 lb. gauge, with 200 deg. superheat, and exhausts to 28-in. vacuum); one 215 h.p. turbo-blower for Peoples Gas Light & Coke Co., Chicago (the tenth set of this size ordered by these people); two underwriter fire pumps driven by 200 h.p. Kerr turbines, for Stieger & Sons' piano factory, Stieger, Ill.; one fire pump driven by 265 h.p. Kerr turbine for B. M. Osbun Co., Chicago. This last named will be the only turbine-driven fire pump in the City of Chicago.

Steel & Radiation, which was recently constituted from several local ironworking concerns, will have Sir Henry M. Pellatt as president, and Hon. J. M. Gibson as vice-president.

Montreal.—The board of control have ordered plans prepared for a refrigeration plant for Bonsecours market. No estimate has yet been mentioned.

The Robb Engineering Co., Amherst, N.S., have secured the following contracts: The Wellesley hospital, Toronto, two Robb-Armstrong engines, direct-connected to Westinghouse generators, for their new power plant; the Imperial Oil Company, of Winnipeg, a Robb-Armstrong engine of 150 h.p. direct-connected to a Westinghouse generator; the Edison Electric Co., Springhill, N.S., a 200 h.p. Robb-Armstrong Corliss engine, direct-connected to electric generator.

The Berg Machinery Co., Bathurst Street, Toronto, are replacing their steam plant with electric drive. The new equipment will consist of twelve motors, totaling 127 h.p.

The Spectator Printing Co., Hamilton, are installing individual motors on all their presses and machinery. The presses are to be driven by variable speed d.c. motors and current for same will be supplied by a d.c. generator, driven by an a.c. motor.

The University of Toronto are installing a 440 h.p. high-speed, compound engine, driving a 300 kw. d.c., 3-wire generator.

Contracts for all the above equipments have been awarded to Chapman & Walker, contracting engineers, 69 Victoria St., Toronto.

The John Inglis Co., Toronto, have recently completed a horizontal cross-compound, double-acting, outside packed pump for the town of Gananoque, Ont. It is of the "tug-of-war" type, and has steam cylinders 13 and 24 inches diameter by 24 inches stroke. The water plungers are 8⅞ inches diameter. The pump runs at 50 r.p.m., and has a capacity of 1½ million gallons per 24 hours, against a domestic pressure of 60 pounds and a fire pressure of 115 pounds. It is arranged with piping and valves so that either side can be run independently of the other.

Jones & Glassco, Nicholas Building, Montreal, advise us that their principals, Hans Renold, Ltd., Manchester, England, manufacturers of Steel Driving Chains, have been awarded the Grand Prix at Turin, Italy, in four classes—these being for their Chains for Engineering, Cycle, Motor-cycle, and Motor Vehicle work.

The main offices of **A. Eugene Michel and Staff, Advertising Engineers,** have been moved into the Park Row Building, 21 Park Row, New York, where larger space has been secured, as necessitated by constantly increasing business.

Jones & Glassco, Nicholas Building, Montreal, inform us that their principals, Watson, Laidlaw & Co., Glasgow, have been awarded one Grand Prize, one Diploma of Honor and two Gold Medals for their Centrifugal, Hydro-Extractors and Cream Separators, at the Turin Exhibition, Italy. The installation which received the Grand Prize was the one in which an electrically-driven, a water-driven and a belt-driven machine were erected on the same framing for comparison of the three systems. The Diploma of Honor was awarded to the Hydro-Extractor method of driving Centrifugals. The Gold Medal was awarded to the Hydro-Extractor exhibited, and the Princess Cream Separator secured the other Gold Medal.

The Cambria Steel Co. has appointed W. Beverly Robinson & Co., Montreal, as its Canadian agents for the sale of rails, billets, cars, wire products, etc.

WATER POWER AND SUPPLY.

Quebec, Que.—Tenders are called until Dec. 20th for new water supply scheme. Consulting engineer, T. A. Jardine Forester, Quebec (A)—44 and 40-in. dia. c.i pipes, specials, valves, etc. (B)—44 and 40-in. dia. steel pipes, specials, etc. Specifications at city hall.

Strathcona, Alta.—Specifications are being prepared for extension of pumping plant. City engineer, A. J. MacLean; superintendent, power plant, Engineer J. Watson. Another unit is contemplated; pump to be for high pressure work and of turbine type either engine or motor driven. Cost estimated at $20,000. Specifications being prepared by Mr. Watson.

Vancouver, B.C.—Water power plant to cost $500,000, Puntledge river, for the Canadian Collieries, of Dunsmuir; contractors, Grant, Smith & Co., Pacific Bldg., Vancouver. Plant will develop 12,000 h.p. hydraulically; power for mines and railway will be furnished. The company will expend $1,600,000 in new equipment and extensions next year in the coal fields on Vancouver Island.

Walter B. Snow announces the recent addition to his staff of Sidney G. Koon, M.M.E., for four years editor of "International Marine Engineering," and later metallurgist, Jones & Laughlin Steel Co.; and also the addition some time since of John S. Nicholl, B.S., lately with the New York Edison Co., and formerly acting manager for F. W. Horne, importer American machinery, Yokohama, Japan. Both are members of the American Society of Mechanical Engineers.

CATALOGUES.

The Positive Clutch and Pulley Works, Ltd., Toronto, have just issued a new catalogue the second in twelve months. This is significant of the rapidly increasing range of their products and the large demand for same. The firm's positive combined jaw and friction clutch is fully described and illustrated, as well as their splitwood rim pulleys with steel centres. A full line of transmission appliances is also manufactured. The catalogue contains numerous useful engineering tables, and should be on the fyle or every superintendent and millright.

Veritys, Ltd., Aston, Birmingham, England, have sent us a circular descriptive of their Radiant Lanterns for tungsten and carbon lamps which are suitable for indoor or outdoor use. Prices are quoted in Canadian currency.

The American Steam Pump Co., Battle Creek, Mich., who manufacture the Marsh and American lines of pumping machinery, have just issued a 188-page catalogue which they will be glad to send to anyone interested in pumping machinery.

The United Engineering and Foundry Co., Pittsburg, Pa., have sent us a copy of their catalogue of High Speed Forging Presses, built under Davy Brothers, Ltd., patents. These presses are of the steam-hydraulic intensifier type, and are built in sizes ranging from 100 to 12,000 tons. A special feature is the patented automatic single lever controlling gear by which all movements are governed. The catalogue is attractively got up, and illustrates numerous press equipments.

The Garvin Machine Co., New York, have forwarded several circulars descriptive of their No. 2 Screw Slotting machine, No. 13 and 13½ plain milling machine, No. 22 Vertical milling machine, and cutter and surface grinders. The contents will be found interesting and valuable to those in the market for such products.

"The Economy Elevator Guide Lubricator, The Lubricator that Lubricates," is the title of an attractive catalog just issued by the Peterson Engineering Co., Lubrication Engineers, Hudson-Terminal Building, New York City. The catalog describes a new method of lubricating elevator guides in which a thin strip of grease is applied exactly where the shoes bear on the rails and for every trip of the car. Several different types are described suitable for steel and wooden rails and also for counter weight guides. Interesting data are given of tests made on elevators equipped with the Economy Lubricator. For instance, it is stated that in the 168th Street Station of the New York Subway, the Economy Lubricator reduced the grease consumption from 480 ounces to 30 ounces per month. An analysis of the cost of lubricating the elevators in the Washington Monument, by means of the Economy Lubricator is also included. Copies of this catalogue may be had by addressing the manufacturer at the above address.

Hawksley, Wild & Co., Sheffield, England, have sent us a 4-page leaflet containing an illustrated description of the "Brightside" water-tube boiler manufactured by them. The cuts represent 4 and 6-drum types for hand-firing, as also an adaptation of superheater and chain grate stoker. The tubes are straight and almost vertical, and are arranged without headers and caps. The arrange-

DIES AND TOOLS POWER PRESSES

For Rapid Production of Sheet Metal Stampings

W. H. BANFIELD & SONS

TORONTO, ONT.

MANY a manufacturer is puzzled with the problem of constructing a special tool or jig to make things go smoother in the shop.

And it isn't every foreman that can solve such a problem.

But let us tackle it—such problems are our specialty. We have been for years devising

Special Machinery, Tools, Dies, Jigs, Etc.,

and have yet to be defeated by a puzzle in mechanical contriving.

Our plant is specialized for the purpose, and our men are especially skilled.

Send your puzzle to us.—Let us solve it to your satisfaction.

Holden-Morgan Company, Limited

Builders and Manufacturers of Automobile Parts, Special Machinery, Tools, Dies, Jigs, Molds and Repairs.

50 Pearl Street, Toronto, Canada

ment generally is compact and provides for high efficiency and ease of overhaul and inspection.

BOOK REVIEWS.

Maximum Production in Machine Shop and Foundry, by C. E. Knoeppel. New York: The Engineering Magazine. This book deals exhaustively with the organization and methods to be followed by a manufacturing concern in order to obtain the highest efficiency in machine shop and foundry, and carries strong internal evidence of the author's intimate acquaintance with the problems that arise in daily practice. We can confidently recommend it to the notice of Business Managers, Works Managers, Chief Accountants and others whose business it is to increase production. Mr. Knoeppel claims that we need to hear more about inefficiency and less about efficiency; and that if we talk about the inefficiencies more, our effects towards eliminating them will be increased, and efficiency, as a natural result will take care of itself. He, by no means, confines himself to broad general theories. On the contrary, having laid down a principle of management, he frequently goes on to give concrete examples of its application, which, are needless to say, both interesting and instructive. Most of the material in the book appeared originally in three series of articles published in the Engineering Magazine. It has, however, been resurveyed, rearranged and largely re-written, and forms a valuable contribution to the subject of scientific management.

"Wood-Turning," by Geo. H. Resides and Hugo Diener. New York: McGraw Hill Book Co. Price $1.50. This publication should be welcomed by students in technical high schools, pattern-maker apprentices, and others interested in wood-working. The book opens with a description of the wood-turning lathe and its equipment, and later, practical exercises are given the student, consisting of chisel handles, vases, urns, etc. Each article is shown fully dimensioned on one page, while on the opposite page are given the instructions to be followed, accompanied by numerous excellent half-tone illustrations. The second half of the book deals with pattern-making in a manner well suited to the needs of apprentices and those wishing to acquire an insight into that trade.

Bearings and their lubrication, by L. P. Alford, M.E., New York, and the McGraw-Hill Book Co., $2.50 net. This book aims to present the underlying principles involved in the design of all classes of machinery bearings. A wide field is covered and numerous examples given together with tables compiled from various sources, both American and European. The laws of friction are so imperfectly understood that a book like the present, which tabulates the results of numerous careful experiments, will be of great use to all designers of machinery and transmission appliances.

The "Mechanical World" Pocket Diary and Year Book for 1912. Emmott & Co., 65 King St., Manchester, England. Price 12 cents. The present number, making the twenty-fifth issue of this little Diary and Year Book, is well up to its usual high standard. Among other new features introduced for the first time are to be found sections dealing with indexing on the milling machine, gauging cylindrical bores, verniers and micrometers, roller bearings, etc. Draftsmen will find the subject of beams and girders clearly dealt with, and several extremely useful tables, giving values of I and Z for various sections, will be welcomed as time-savers, where calculations are concerned.

Hoffman Steel Balls

are recognized throughout the world as the best made. Each and every ball, of whatever size, is guaranteed **correct within 1/10,000 of an inch** both in size and spherity.

That means that when your bearings are equipped with Hoffman Steel Balls the load is evenly distributed, every ball taking its share, bringing friction and wear down to a minimum. The high elastic limit of their glass-hard surfaces, obtained by our special tempering processes, makes Hoffman Steel Balls the most durable.

These are the telling points about

Bakelite

Valve Discs

THEY will not leak under high temperature, excessive pressure or when used in acids or other special liquids. Neither cold water, dry or superheated steam has the least effect upon them. BAKELITE Discs are a gas-tight fit.

BAKELITE is a successful substitute for expensive metal. Its structure is fibrous, giving strength and hardness. It can be reground and refaced, always retaining a uniform surface. It cannot be injured except by accident or friction.

Remember Bakelite Pump Valves do not warp with change of temperature.

Order your valves fitted with Bakelite Valve Discs and stop that perpetual annoyance and expense caused by leaking valves. Depend upon it, Bakelite Valve Discs will not leak.

Write for prices or ask your dealer.

WATEROUS CENTRIFUGAL SPLIT-BASE PUMPS

What They Will Do—and How

Waterous Pumps are designed to handle foaming, non-foaming and precipitating liquors, pulp stuff, and water—hot or cold—containing up to 20% suspended matter.

They can be adapted for circulating condenser water, pumping sewage, excavation work, sand dredging, irrigation pumping, mine drainage and handling pulp stuff.

Waterous pumps are built in sizes up to 14 in. discharge opening—in both horizontal and vertical types—and are adapted for engine, motor or belt drives.

The split-base—a Waterous feature—allows all working parts to be lifted bodily from the base without disturbing the foundation bolts.

Packing gland is split to increase accessibility. There are no restricted water passages to clog up, no valves or eccentrics to get out of order.

Write for illustrated catalogue No. 200.

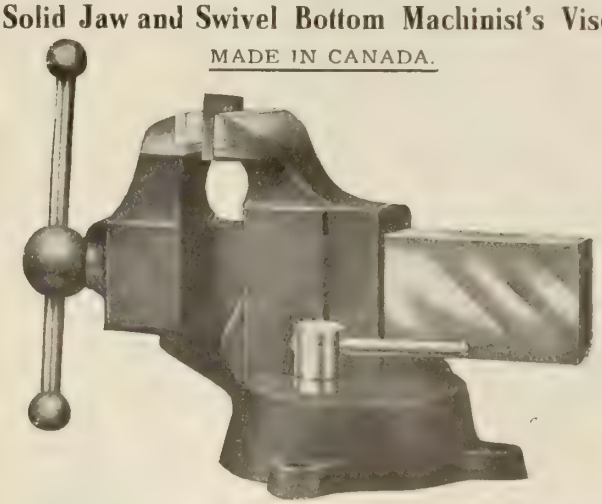
THE NATIONAL TOOL CO.



Cleveland
Sixth City

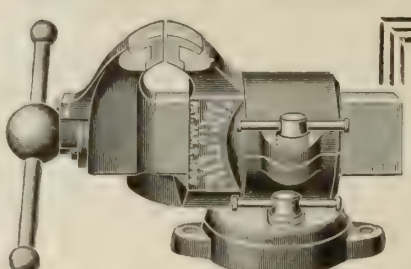
—The YOST—

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.

A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is



Incomparably Good

The National catalog would certainly interest you. Write us, asking for a copy.

National Machinery & Supply Co., Ltd.

HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

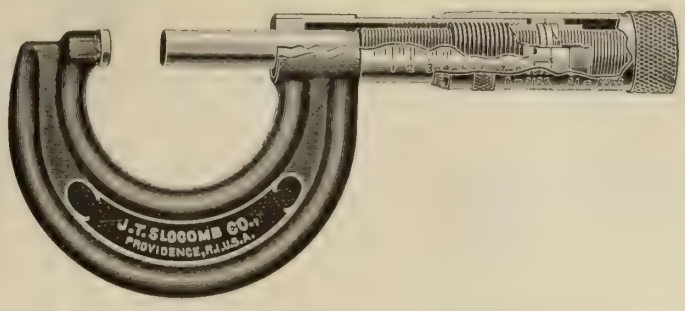
EVERY MECHANIC

who is pressed for time cannot use a vise that will be more convenient and more positive in its grip than

PARKER'S

Double Swivel Vise

With this vise it is not necessary to remove the work from the vise jaws.



The vise can be swiveled on base or turned in barrel without opening the jaws, and is held in position by a turn of the tightening studs.

All our vises have a solid steel bar strengthener also solid under portion of front jaw. The jaw faces are made of the Best Tool Steel and are removable and renewable at any time.

Write for illustrated catalog.

The Charles Parker Co.

Meriden, Conn., U.S.A.

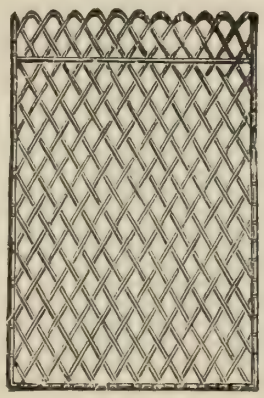
AGENTS

In certain cities in Canada we are ready to appoint agents in factories and should be glad to hear from any parties interested.

Our tools are so very satisfactory and economical that good machinists are always interested in them. We want only parties who are in a position to get orders, but those parties can dispose of these tools readily, securing something for their efforts and supplying tools which are guaranteed equal to any on the market.

Ask for Catalog 12C.

Makers of Slocomb Semi High Speed Steel Combination Centre Drills, Slocomb Micrometer Calipers. All sizes to 24 ins. inclusive.



J. T. SLOCOMB CO., - Providence, R.I., U.S.A.

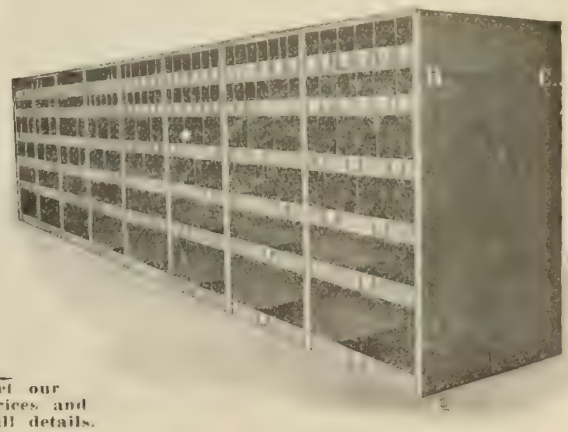
No More Broken Windows

The factory or mill lighted by a great number of windows can save a lot of money annually by preventing those windows from breakage. For this purpose nothing equals, in economy, efficiency or good appearance,

GREENING'S
WIRE WINDOW GUARDS

Once bought and put in place these guards will last a lifetime. Accidental breakage is made almost impossible. Nothing can fall out of the windows protected by Greening Guards. They mean a saving in expense and an improvement in appearance from every point of view. And, on account of our enormous output of these and similar goods, our prices are the very lowest procurable

Write us for Catalogue No 4 and Samples.



The B. Greening Wire Co., Limited
Hamilton, Ont. Montreal, Que.

"D.L." Standard
STEEL SHELVING

is much stronger and occupies much less space than wooden shelving.

Besides this, it greatly reduces fire insurance rates and promotes system among employees.

Our Steel Shelving and Bins are adjustable, and sections can be added as requirements expand. Shelves can be converted into Bins, using Steel Bin Shelf Attachments. All Bins and Shelving compartments are furnished with label holders

Get our prices and full details.

London - Canada
Toronto Office, 12 Queen Street East.

Has Your Factory Plenty of Light and Fresh Air?

That these are *absolute necessities* in modern factory and office buildings no man who has a shred of progressiveness in his make-up can argue.

Poor daylight and insufficient ventilation mean tired employees, short days, big lighting bills and decreased output.

Yet the ordinary wood sash for factory buildings, if of sufficient size, is so heavy and clumsy in structure that it is not only very *expensive* but *obstructs a large part of the lighting area*, and the difficulty of opening it, particularly in cold or damp weather, prevents proper ventilation.

"Fenestra" Solid Steel Sash

is a light, strong steel frame and sash combined, admitting from 25 to 40 per cent. more light through an opening than wood sash.

Not only does it increase the effective lighting area by occupying less space itself, but, because of its almost unlimited resistance to wind-pressure, windows may be built of it in almost any size.

"Fenestra" Sash encourages your employees to properly ventilate their work-rooms by making it easy and handy to open and close the ventilators. "Fenestra" ventilators do not swell in damp weather nor freeze up in winter. Replace the foul air and the smoke and gas-laden atmosphere in your factory with fresh air, give your employees plenty of daylight and watch the effect on your output and lighting expenses.

Bear in mind, also, that "Fenestra" Sash are *fireproof* and materially lower insurance rates.

They are made in any size or shape, and are always built to supply individual needs.

If you are planning or erecting an industrial building of any kind that you intend to make permanent let us send you our "Fenestra" catalogue. A post card brings it to your desk. Address "Steel Sash Branch."

Machinery Wanted and For Sale

To the Readers of "Canadian Machinery"

On page 87, October edition of Canadian Machinery appeared one of the greatest offers yet offered to its readers. Read the advertisement mentioned, and then carefully consider this offer. Subscribers to

Twenty Century Mechanics

are wanted, and SATISFIED SUBSCRIBERS above everything else, therefore I personally agree to refund your money if, after receiving the Twenty Century Mechanics for one year, you feel you did not get value received. I have faith in you—that is why I make this offer. Also, I know that Twenty Century Mechanics will exceed your expectations, and for that reason I can afford to make the above offer. You are to be judge; your word is final, and I hope you will SUBSCRIBE AT ONCE. The Subscription is ONLY $1 per year. Address,

H. S. Jeffery, President
Jeffery Correspondence Schools,
Washington, D.C.

A GOLD MINE

SAVE YOUR IRON

SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE **W. W. SLY MFG. CO., CLEVELAND, O.**

The Making of Hollow Castings

The recent introduction of King Kore Kompound has now rendered this, once somewhat difficult, part of Foundry practice comparatively easy.

It has, also, reduced the core expense by more than one-half.

This compound is a black, dry powder, and is used as flour is used, but with one-half the quantity is produced greater and better results.

Its use avoids the danger of swelling or "blowing." The core easily comes out of the casting, and when old cores are ground up, in the rattler, or otherwise, the sand so made is used over again.

The core compound it contains, again becomes a binder under heat of the core oven, as it melts, and so it is used over and over again.

This is Foundry Economy; Flour, Rosin, etc., are now luxuries.

A barrel of King Kore Kompound will be sent "subject to approval" to any inquiring mind.

That is the **Stevens' System** of trying before buying.

I have copies of proportions of compound to sand used and methods followed in core rooms of Foundries in thirteen different States. This information, with other printed matter relative to the subject, will be mailed on request.

I maintain a direct branch at 137 Jarvis St., Mr. J. M. Mayers, Manager, Toronto, Ont., where is stocked a supply of **Foundry Facings, Foundry Supplies, Buffing Compositions**, of my own manufacture.

The stamp of quality pervades them all.

FREDERIC B. STEVENS

DID YOU EVER HEAR OF STANDARD TUBING?

¶ Maybe not, but you've seen millions of feet of it, for the frame of nearly every bicycle and motorcycle is made of it.

¶ Standard Seamless Steel Tubing is made of strips rolled accurately to gauge. These are then folded into tubular form, the edges heated, under lateral compression, by electricity until they conjoin into one homogeneous mass, producing a tubing as perfect and as whole as the product of a mold. They then pass through finishing operations and inspections which guarantee to the buyer a tubing whose strength, density, accuracy, and finishing surface, cannot be excelled.

¶ Being light, durable, and manipulative, the uses to which it can be put are innumerable, ranging from clock work to aeroplane frames.

¶ It might benefit you to look over your product for the purpose of determining whether you can use Standard Tubing. If you can, your costs will be reduced, and the quality of your product improved.

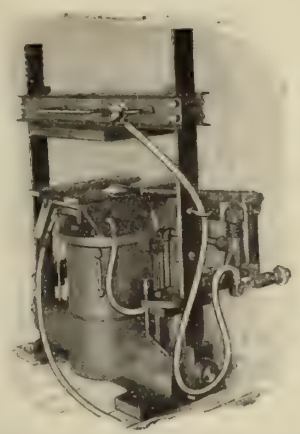
SPOT WELDING

DIRECTORS
ROBERT HOBSON
President
W. W. BUTLER
C. W. KINSELLA
A. J. NESBITT
A. M. IRVINE
Vice-Pres. and
General Manager

We own and are operating the Rights of the Universal Electric Welding Co. and the Thomson Electric Welding Co. in Canada, covering Electric Spot or Point Welding.

We guarantee Greater Efficiency than any other Electric Welder on the market.



Our machines are not restricted to 1/16" and under. With our method, we can Spot Weld plates 1" thick and over.

The same machines used for welding the heavier materials can also be used for the lighter or thinner metals.

SAVES MATERIAL. SAVES LABOR.

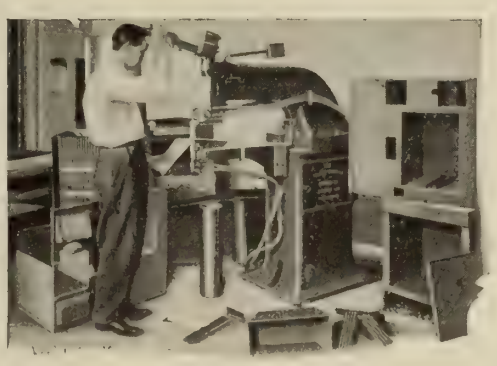
Canadian Electric Welding Company, Limited

Bank of Ottawa Building, - MONTREAL

A LIGHT POWER SQUEEZER FOR BENCH WORK

and a complete line of

FOUNDRY MOULDING MACHINES FOR ALL KINDS OF FOUNDRY WORK



Standard and Other Types to Suit Conditions

THE TABOR MANUFACTURING CO.

18th and HAMILTON STS. PHILADELPHIA, PA., U.S.A.

THE ELECTRIC WAY OF RIVETING

NO HOLES TO PUNCH. NO RIVETS USED.

What a Stove Manufacturer Says:

"We welded 655 sheet steel ranges and 582 closets last month with our new "Toledo" welding machine.

Our current cost	$ 5.75	
Total labor	87.00	$ 92.75

"Before buying your welder we riveted these ranges and closets. We paid for riveting 35c per range.

655 ranges at 35c	$229.55	
Rivets	8.50	$238.05

"We saved $145.30 on this work alone in one month."

Another Manufacturer

put a "sod buster" at work on his welding machine. He's welding 18 and 20 gauge steel. The current costs 50c per day at 8c per K.W. He averages 1650 welds per hour. That's how fast he did it and a better job than the old way of riveting.

ISN'T THAT INTERESTING?

Better write to-day and let us show you in actual figures whether a saving can be effected in YOUR work.

NO LEASE. NO LICENSE. NO ROYALTY.

Our sheet metal worker's hand book will tell about it, and it's yours for the asking.

THE TOLEDO ELECTRIC WELDER CO.

"CUMMINSVILLE," CINCINNATI, OHIO, U.S.A.

Why Did Your Dies Break?

Do You want your Dies to stop breaking?

SISCO ACORN STEEL FOR DIES

will stop it.

SISCO ACORN is tough and will resist shock and vibration better than any other steel.

YOU TAKE NO RISKS.

We cancel **all** charges for steel and freight on return of unused quantities, if Sisco Acorn does not meet our claims for it. We give you an iron-clad guarantee. Put us to it.

Write to-day.

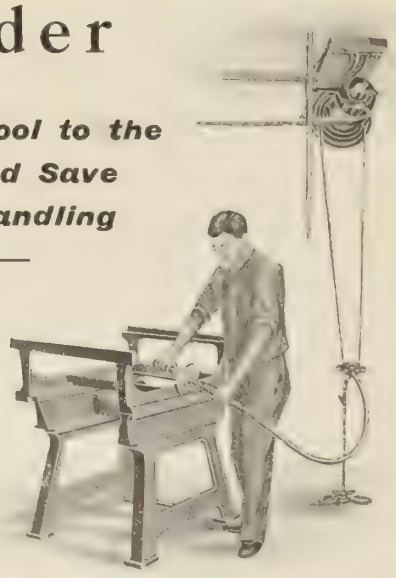
Swedish Iron & Steel Corporation

12 Platt Street, - NEW YORK.
428 Race Street, - NEW ORLEANS, LA.

"MORSE"

TWIST DRILLS
REAMERS
MILLING CUTTERS
OF CARBON AND HIGH SPEED STEEL

cut down the cost of the operation and raise the standard of the finished product, being scientifically made in the "Morse" way to successfully meet the exacting demands of skillful users.



Using "Morse" Tools Means Efficiency and Economy

Morse Twist Drill & Machine Co.

NEW BEDFORD, MASS.

Portable Emery Grinder

Take the Tool to the Work and Save Heavy Handling

We are Inventors of the **Flexible Shaft** For all Purposes

The oldest and largest manufacturers in the world.

CAN FURNISH MOTOR DRIVEN WHEN DESIRED

Write Us for Catalogue and Prices.

85 Queen Victoria St., LONDON, ENG.

A WARNING
TO MECHANICS

A man is judged by the grade of work he turns out, and in order to turn out this good work he must use quality tools.

BUTTERFIELD'S
Taps, Dies and Reamers

will best meet his requirements if such tools are needed.

They have been on the market for over 30 years and have a durability and accuracy that made them popular with every skilled mechanic who has used them.

These tools will save you trouble—write at once.

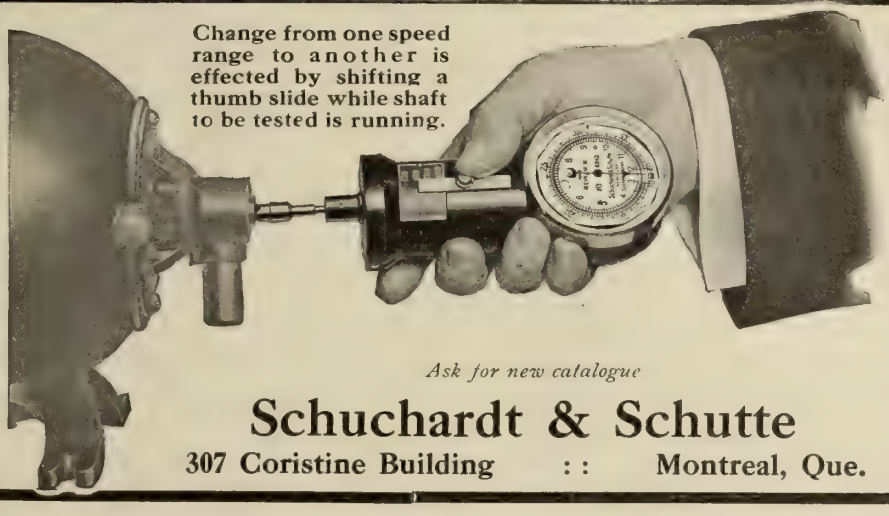
CLEVELAND HIGH SPEED DRILLS



Hold World's Drilling Record

57½ Inches—Almost 5 Feet Per Minute—Thru Cast Iron

Folder No. 32C Gives the Facts. Write for it To-day.

THE CLEVELAND TWIST DRILL CO.

New York CLEVELAND, O. Chicago

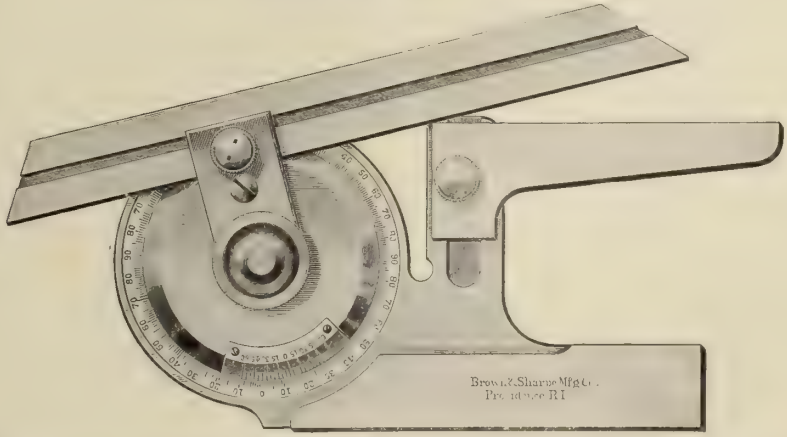
Change from one speed range to another is effected by shifting a thumb slide while shaft to be tested is running.

Ask for new catalogue

Schuchardt & Schutte

307 Coristine Building : : Montreal, Que.

ONE SPINDLE FOR ALL SPEEDS



S & S Tachometers

Are the simplest, most efficient measuring devices, universally applicable for rotation and progressive speed.
They give an accurate, independent reading—no watch required—and instantly record the slightest speed variation on both right and left hand motions.

Sizes and styles for all requirements

B. & S. Improved Universal Bevel Protractor

With Acute Angle Attachment.

The addition of the Acute Angle Attachment to the Protractor makes its use practically unlimited in its class. Exceptionally small angles can be laid out or established, and, because it is flat on one side, it can be laid flat on the stock or paper, a distinct advantage.

DIAMOND
High Speed Drills

Will put your factory drilling department on an ECONOMY BASIS that will soon show on YOUR COST SHEETS.

The Consumer of drills naturally has his factory difficulties to solve. He must select those drills that will accomplish QUALITY RESULTS for his products, at a cost that will give him a profit.

We have made **CAREFUL, SCIENTIFIC** and **MECHANICAL STUDY** of these problems. Consequently, we can tell you wherein your trouble may be overcome by using the right kind of drills of the correct temper and character of steel.

We make drills for all classes of work. HERE IS WHERE WE CAN MEET ON A PROFITABLE BASIS. Suppose you write us about those conditions and difficulties. **WE WILL ADVISE** you as would your Physician, your Attorney or your Banker, and place at your command the fund of results accumulated for years in our scientific testing department.

WE HAVE BATTLED with your problems for many years and Solved Them. You may be assured our advice will save you money. If the drills you are now using have that "W & B DIAMOND" TRADE MARK ON THE SHANK, YOU ARE RIGHT.

Write for Catalogue 74 C.

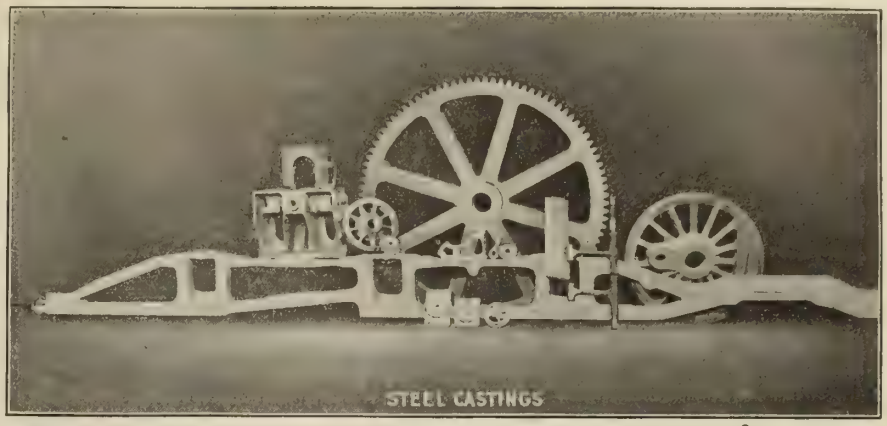
SUCCESSORS TO

Montreal Steel Works, Limited and Ontario Iron & Steel Co. of Welland, Ont.

Manufacturers of



STEEL CASTINGS
(Acid and Basic Open Hearth Systems)

SWITCHES AND TRACK WORK
for Steam and Electric Roads

SPRINGS
of all kinds

MANGANESE STEEL CASTINGS
for wearing Parts, insuring Great Hardness and Durability

INTERLOCKING PLANTS
TRUCKS FOR ELECTRIC CARS

BAR STEEL and ANGLES and the following types of COUPLERS:
SHARON, TOWER, CLIMAX, LATROBE, MELROSE, CHICAGO, R. E. JANNEY and SIMPLEX.

AGENTS FOR CANADA FOR

Barrow Hæmatite Steel Co., Barrow-in-Furness, England

Quotations for Tee Rails, Fish Plates, etc., promptly furnished. Catalogues sent on application.

STEEL

Sheets and plates – any width up to 50 inches, any thickness up to one inch.

Merchant bars, shafting and heavy forging of all kinds.

PIG IRON FOR FOUNDRY USE.

UNSURPASSED EVAPORATION HIGHEST IN CARBON **COAL** LOWEST IN ASH BEST ALL ROUND STEAM COAL.

Steel Castings

One of the two largest steel castings ever made in Canada was cast by us. They were Y-pipe connections for a 10,500 H.P. water wheel. We made it for the John McDougall Caledonian Iron Works, and they were thoroughly satisfied.

Absolute Satisfaction is Guaranteed

JOLIETTE STEEL AND IRON FOUNDRY CO., LTD.

Foundry—Joliette, P.Q. *Montreal Office—371 St. James Street*

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

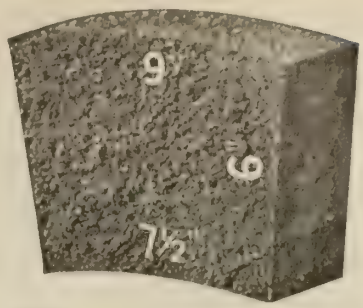
FIRE BRICK

AMERICAN and SCOTCH



CUPOLA BLOCKS and all other SPECIAL SHAPES

For Foundries, Blast Furnaces, Rolling Mills, Steel Plants, Cement and Lime Kilns, Glass Plants, Boiler Settings, etc.

IMMEDIATE SHIPMENTS
from our stock in Toronto, or direct from Works.

The Ontario Lime Association
LIMITED
118 Esplanade East, - TORONTO

FIRE BRICK *for* Cupolas

¶ The standard Fire Clays by which all other Clays are judged are those of Pennsylvania.

¶ They're the ones from which our Cupola Brick are made.

¶ The cost per thousand means nothing unless you know the results the Brick are giving.

¶ Write us for definite examples of how our material affects your melting costs.

HARBISON-WALKER REFRACTORIES COMPANY,
PITTSBURGH, PENNSYLVANIA

We Have Them **THE BEST GOODS FOR THE LEAST MONEY** You Want Them

HERE ARE THREE OF THEM

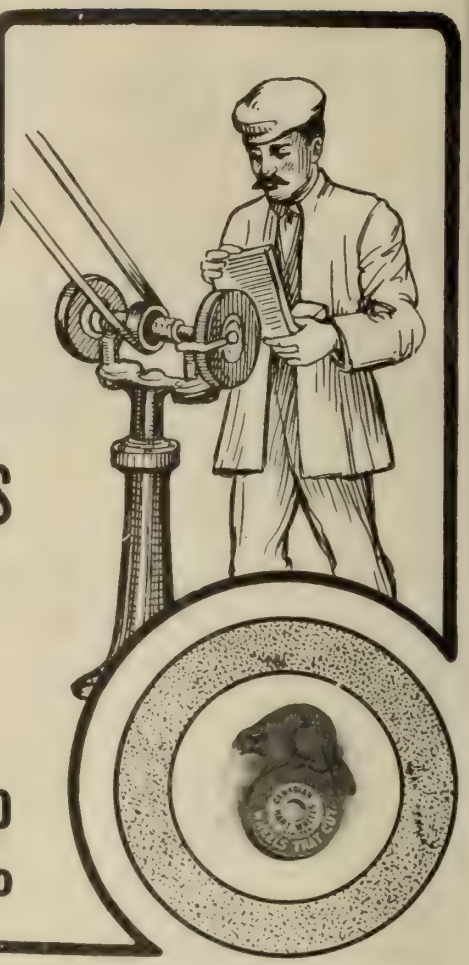
NO. 48 EAST INDIA PLUMBAGO

A quality of lead of uniform grade, high in fixed carbon. Guaranteed to slick, rub or brush on mold. It will not wash or run before the metal. Try a barrel on approval; we take it back if not satisfactory.

EUREKA BLACKING

We still insist that this blacking is the best core wash on the market. It will not rub off from the core; it will peel perfectly; it will not foam; and requires only clear water to prepare it. Order a trial bbl.

DETROIT CORE COMPOUND



A core compound adaptable for all cores, but more especially for brass. Imparts a hard surface and a soft centre. It is economical and satisfactory in every way. Help yourself to a barrel by writing us an order now.

THE DETROIT FOUNDRY SUPPLY CO.

DETROIT, MICH. WINDSOR, ONT.

QUALITY UNIFORMITY SERVICE

The Daily Grind

The daily grind of mechanics engaged in using abrasive wheels is made much more effective if their machines are fitted with

CANADIAN HART CORUNDUM WHEELS

Our wheels are free and fast cutting, porous, safe, and very durable. Send for our catalogue which describes the various processes used in making Canadian Hart Corundum and Emery Wheels.

THE New McDougall Lathe is strong and solid at the gap. It cuts clean. It is quickly adjusted. Its use means a bettered quality of product and a speedier output. Modern factory efficiency demands a lathe like this. Write for particulars.

DESCRIPTION.

Headstock construction prevents chattering, and deep oil chambers fitted with ring oilers make spindles and bearings self-oiling and always well lubricated.

Tailstock of a special type, and sleeve is clamped by a quick acting locking device. Tailstock is secured to bed by bolts adjusted from the top where they are easily accessible.

Bed, non-springing and webbed, and braced to secure rigidity.

Gap, vibration absolutely prevented by use of brace supports to carriage.

Spindle, high carbon hammered steel in solid chilled cast iron bearings, accurately fitted and self oiling.

Carriage and Apron, non-springing under severest strain, full "V" bearings and flat bearings in addition on front ways.

Double Back Gears give eighteen distinct spindle speeds, suiting lathe to work on widely different diameters.

Compound Rest, with graduated base, accurately fitted taper gibs, end adjusted. Screws in both rest and cross slide read to thousandths.

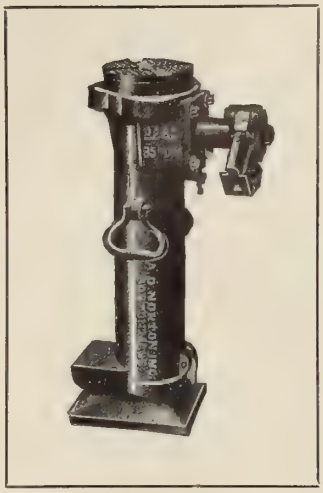
Friction, Safety Feeds, screw and rod feeds cannot be both engaged at the same time. Quick changes of 1¼, 2½ and 5 times thread being cut.

Gears and Racks, cut from solid and steel where necessary.

Screw Cutting, full range of commercial threads provided for.

Equipment, Compound rest, steady rest, follow rest, large and small face plates, wrenches, two-speed, friction countershaft furnished with each lathe.

Accuracy, Strength, Solidity, Wear. These are the paramount features behind all McDougall Machines. Made to meet extreme demands.



The R. McDougall Co., Limited, Galt, Canada

Cable Address: Dougalt. Code: A B C, 5th.

High Speed Steel Drills and Reamers	133
High Speed Gear Cutter	16
Holding Leather on Iron Pulleys	47
Hollow Mill, An Adjustable	244
Home Made Reaming Stand	246
Home Made Stillson Wrench	71
How to cut a Curve on a Planer	162
Increased Vise Facilities	186
Inserted Blade Tools	303
Inserted Cutter Taps and Dies	46
Interesting Piece of Forging Work	187
Jig for Facing Twin Pumps	15
Jig for Drilling Irregular Holes	271
Jig for Holding Castle Nuts for Slotting	17
Jig for Locomotive Side Rod Brasses	219
Large Job in Small Shop	15
Lathe Centreing Device	247
Locomotive Jack	132
Machining a Dog Tooth Clutch	219
Machining Rudder Stem	46
Making Gas Engine Valves	302
Novel Counterbore	339
Oil Burner, A Simple	247
Pitch of Propeller	16
Pipe Centre, A Simple	186
Pipe Die, How to Sharpen	17
Planer Extension	133
Planer, How to Cut a Curve on	162
Planer, Increasing Capacity of	162
Planer, Work that is too Large for	133
Plate Handling Device	132
Pneumatic Feed for Air Drills	270
Portable Electric or Air Drills, D. C. Current	107
Port Drilling Jig for Pneumatic Hammer	107
Power Hack Saw	301
Press for Air Brake Cylinder Cup Leathers	246
Preventing Taps from Breaking	303
Rail Clamp, An Improved	247
Ratchet Stud Driver	247
Reaming Stand, A Home-made	246
Reboring Cylinder	126
Retarders for Boiler Tubes, Method of Twisting	340
Roughing out Irregular Shapes on a Lathe	245
Rope Groove Grinding Apparatus	105
Rudder Stem, Machining a	46
Russell Automobile Brake	44
Saving Sheet Metal	16
Sawing Sheet Iron or Pipe	44
Shop Kinks	46
Simple Chuck	244
Simple Grinding Fixture	106
Simple Oil-Burner	247
Simple Pipe Centre	186
Spacing Circles	304
Stacking Motor Rotors	186
Stillson Wrench, A Home-Made	71
Supporting Countershaft	77
Taper Dowel Hole Reamer	44
Tempering Small Shear Blades	18
Tire Heating Apparatus	341
Tire Lifting Grips	270
Toggle Joint Action	16
Tube Cutter	132
Tube Cutters, Two Useful	220
Turning Die Sections of Large Radii	44
Twisting Retarders for Boiler Tubes	340
Wire Cutter, Hand	301
Working in the Dark	187
Work that is too Large for the Planer	133
Worm Gear Oiler	45
